LAND LEDGER

FULL PRODUCT DEMO WALKTHROUGH

Every record sealed. Every action accountable.

A complete guided tour of the platform - ten acts, sixty-one screens, five roles, one blockchain-backed land registry. Read it as a script, present it as a story.

10 ACTS | 61 SCREENS | 5 ROLES | LIVE MFA | ON-CHAIN PROOF

Prepared 12 October 2026

Companion recording: land-ledger-full-demo.mp4 (7:15)

RUN SHEET

How to run this demo

This deck mirrors the companion recording shot for shot, so you can present from either. Follow the ten acts in order; every screenshot has a caption you can read out or paraphrase.

THE TEN ACTS, IN NARRATION ORDER:

01	**The public face**	Landing, features, how it works - set the stage.
02	**Sign-in and MFA**	Password plus a real six-digit email code.
03	**The citizen's world**	Om's dashboard, property, ownership chain.
04	**Citizen workflows**	Documents, the transfer case, the ledger.
05	**The theme morph**	The circular reveal - show it, then move on.
06	**Multi-party consent**	Shruti and Ganesh approve; status advances.
07	**Surveyor on the ground**	Field inspection recorded in structured notes.
08	**The verification desk**	SHA-256 checks; the actual PDF opens.
09	**Registrar and the ledger**	Approved and written to the blockchain.
10	**Institution oversight**	Admin's control tower and audit trail.

QUICK START

1. Open the published link - the landing page is your opening slide.
2. Sign in as Om Mandwade using a demo chip; read the OTP from the real email that arrives.
3. Walk Acts 3-5 from this deck; flip the theme on camera in Act 5.
4. Play the consent scene live: Shruti and Ganesh approve TRF-2026-0001 from their own accounts.
5. Finish with the offices - surveyor, clerk, registrar - then close on Admin.

WATCH IT FIRST

land-ledger-full-demo.mp4 - 7 minutes 15 seconds, the full story performed live on a pristine seed, in the same order as this deck. Screenshots in these pages are frames from that same capture session.

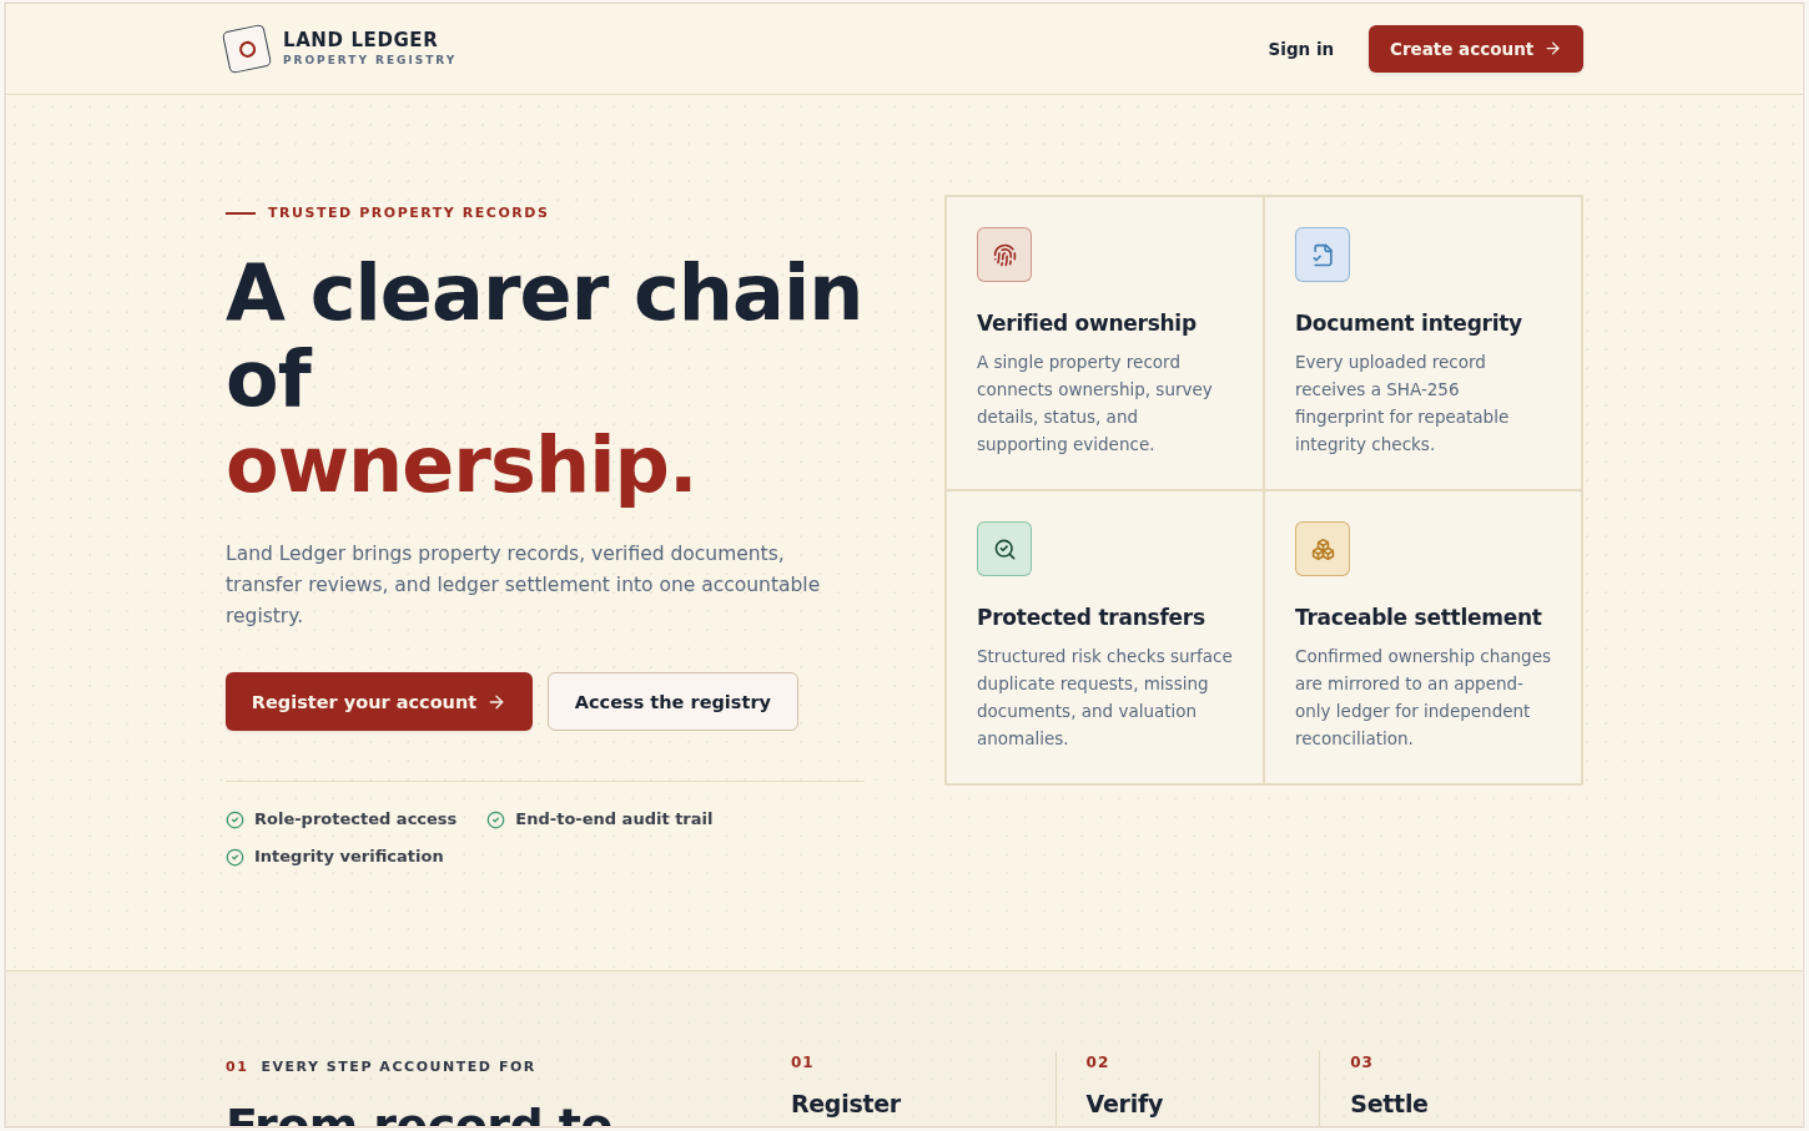

ACT 01 · SCREENS 01-03

The public face

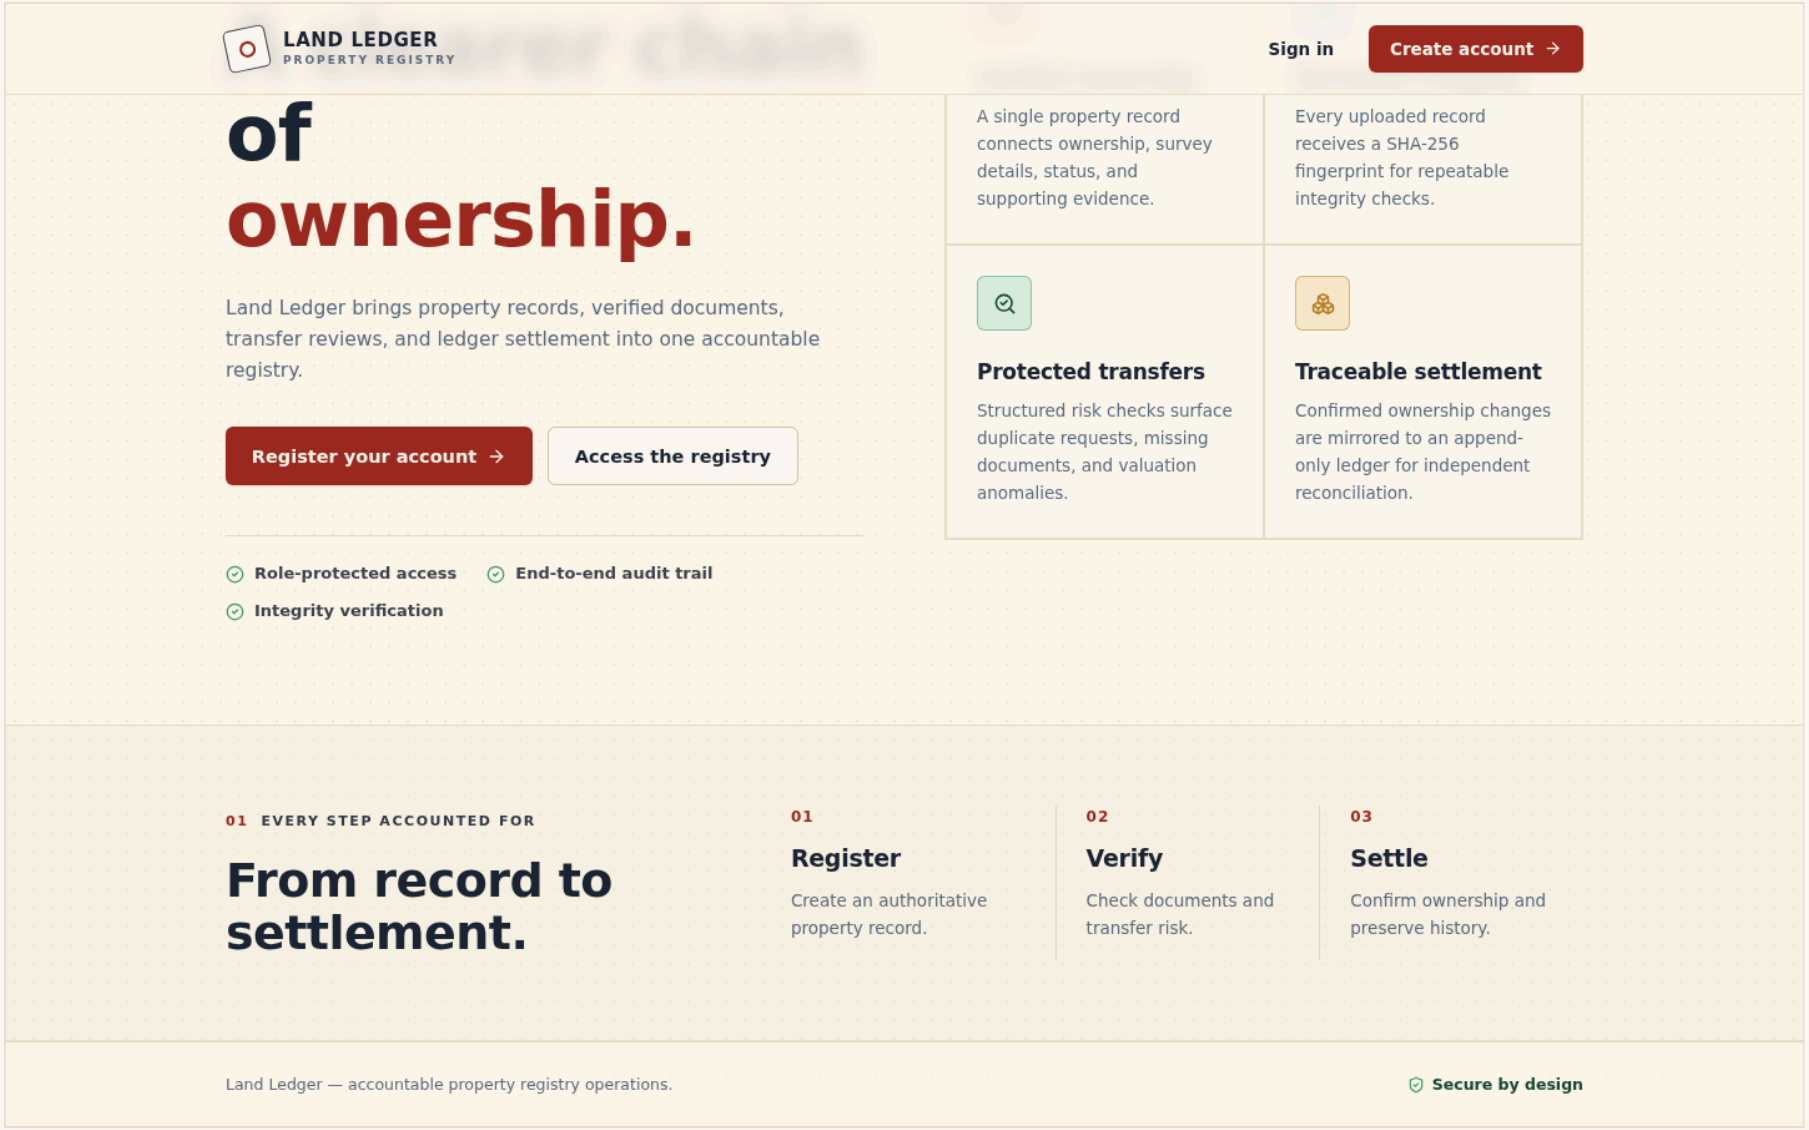

01

Before any login, the product has to make its case. The landing page compresses the whole promise - tamper-evident land records, accountable offices and real blockchain proof - into a single scroll. These three screens are your opening minute, so let them breathe.

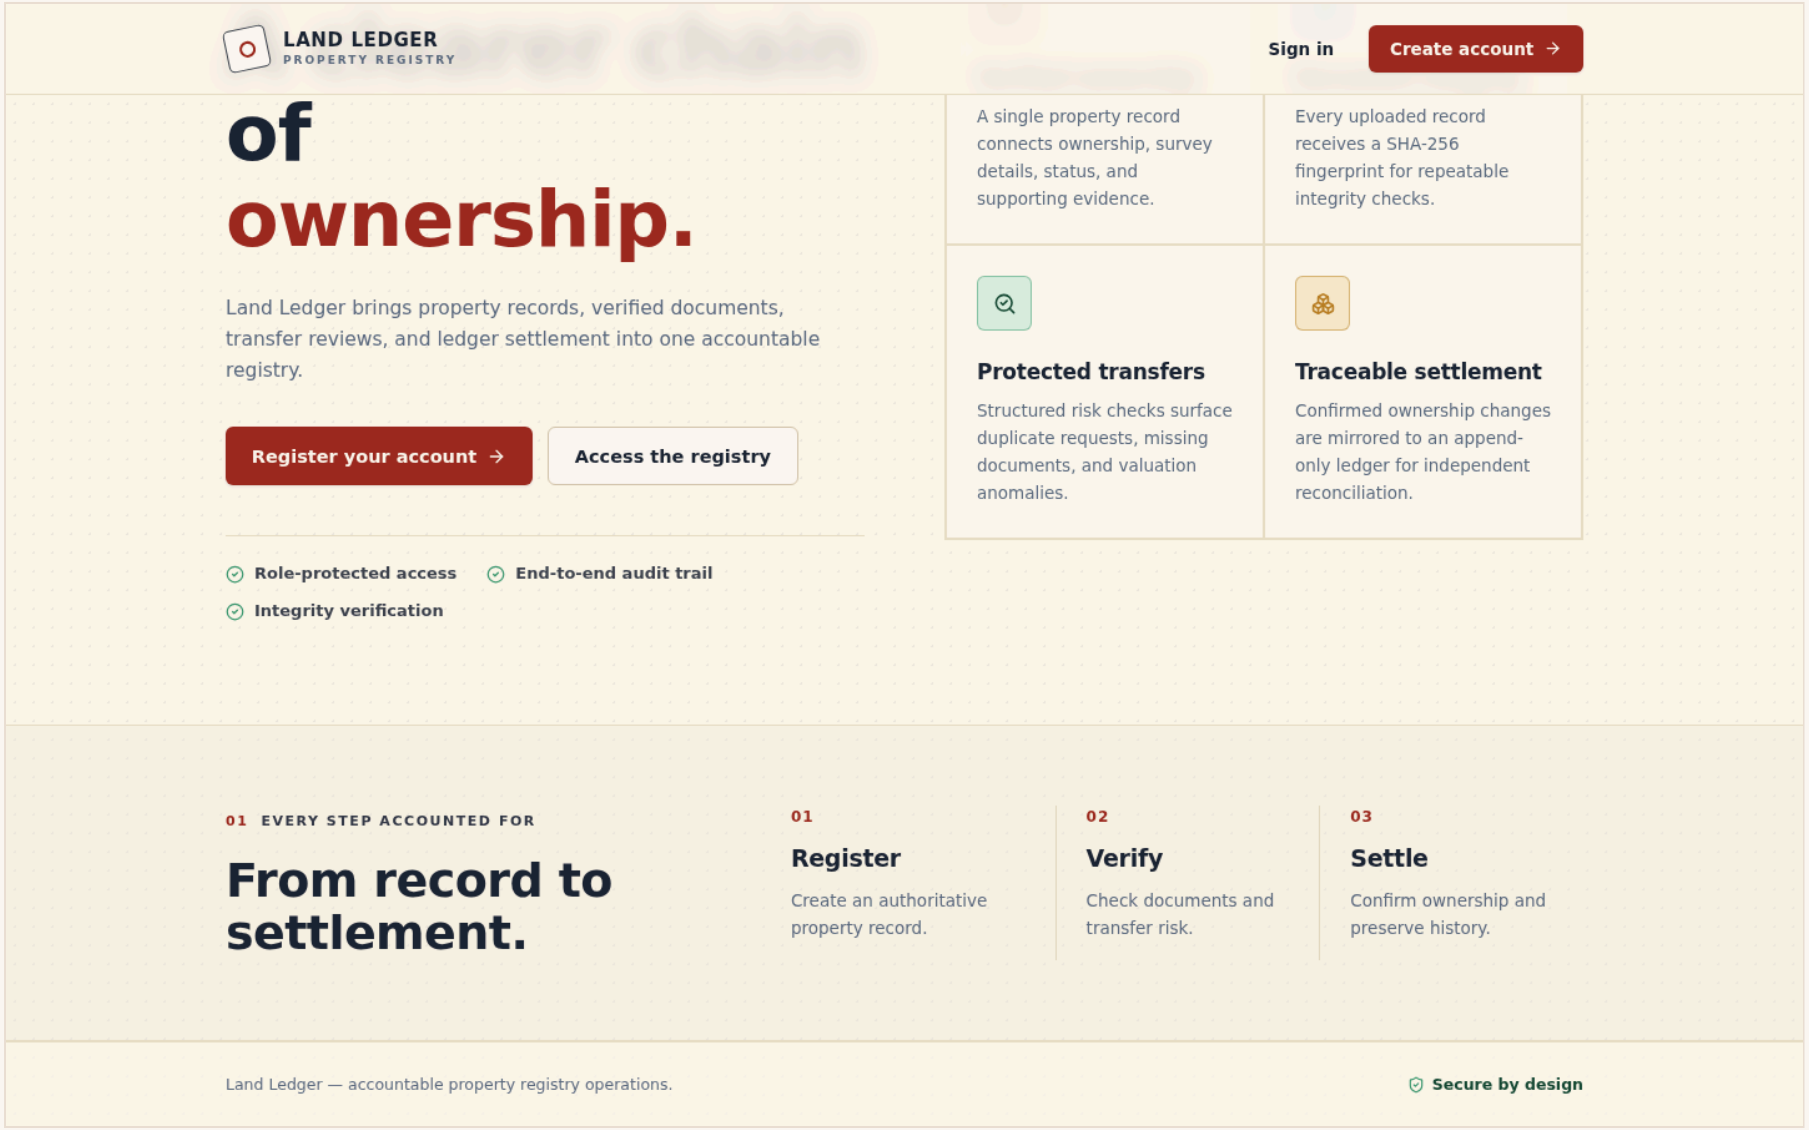

Landing - the opening promise

LAND LEDGER introduces itself as a blockchain-backed land registry: every record sealed, every action accountable. One line sets the stage before anyone signs in.

The feature grid summarises the product: on-chain proof, role-based offices, multi-party consent, document integrity and an immutable audit trail. Point at two or three, promise the rest.

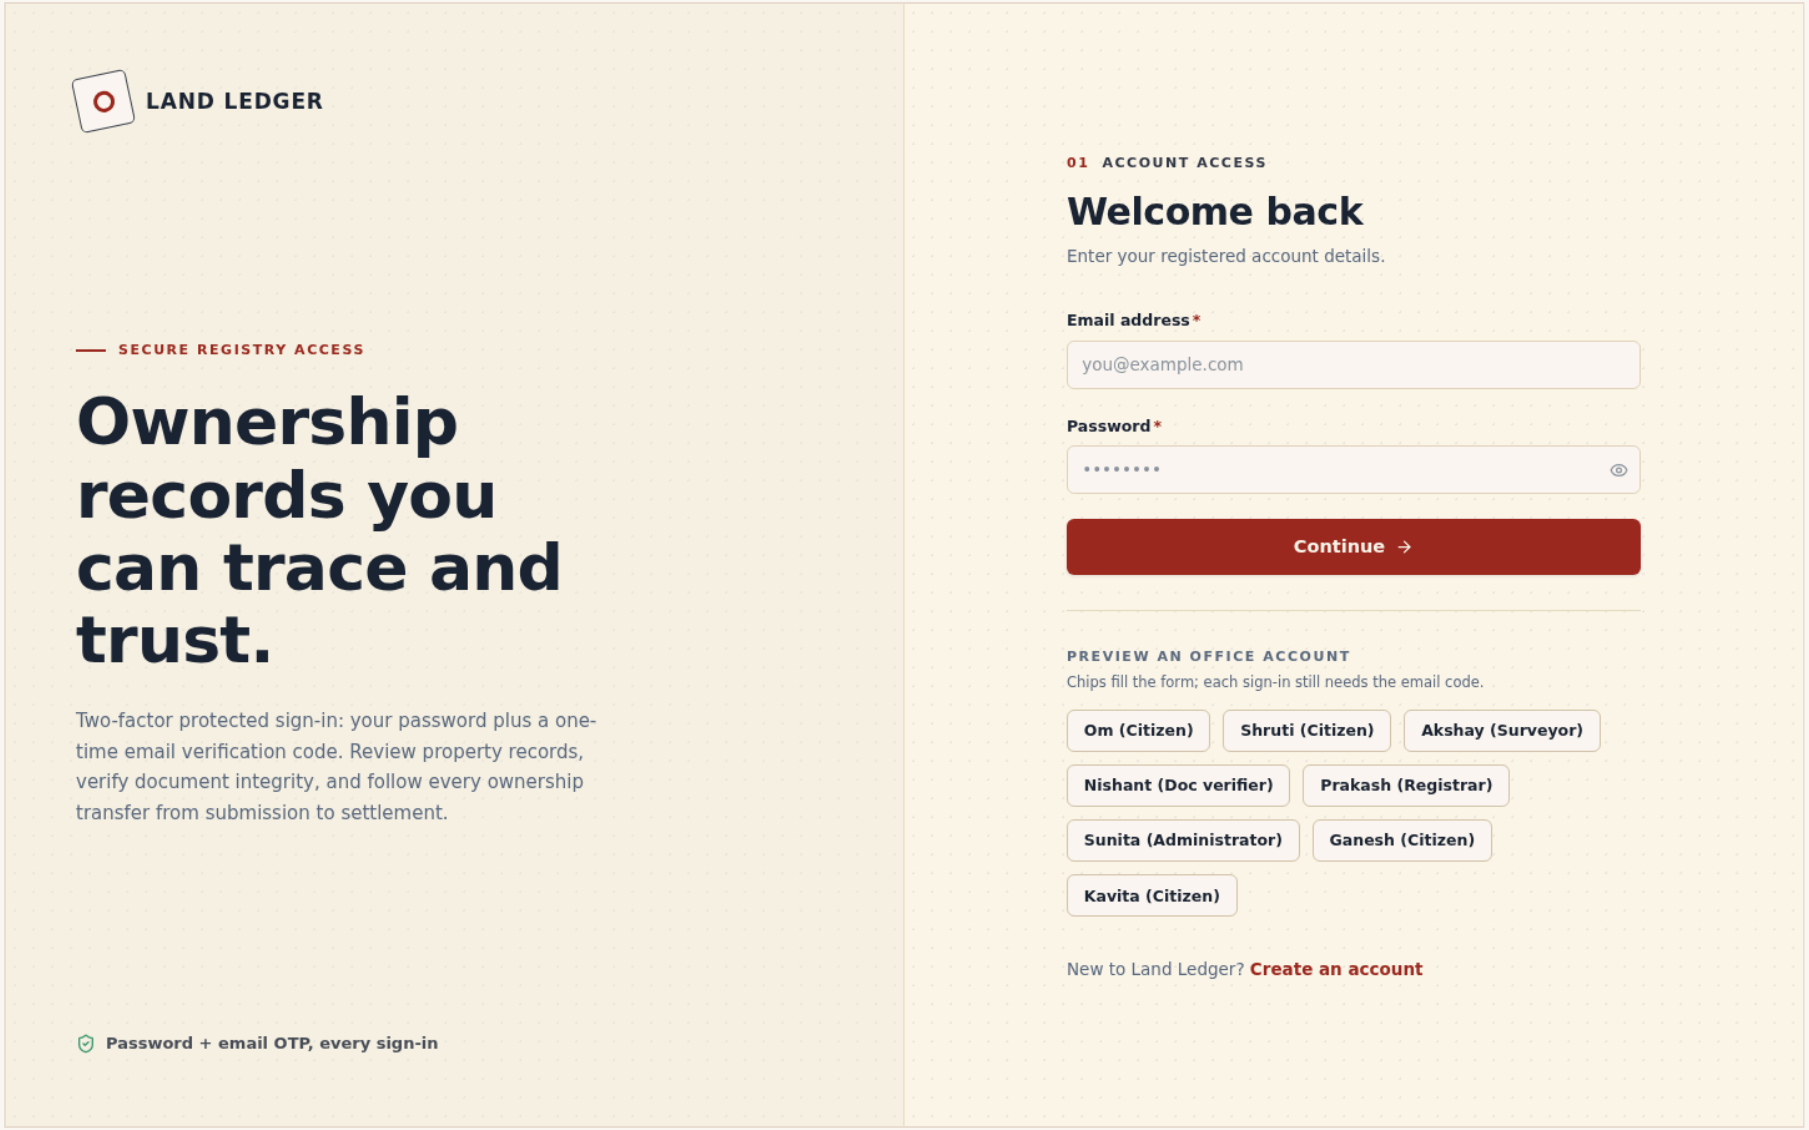

Register a property, pass office verification, settle the transfer - the three-step journey tells evaluators the whole workflow before they ever touch the app.

ACT 02 · SCREENS 04-06

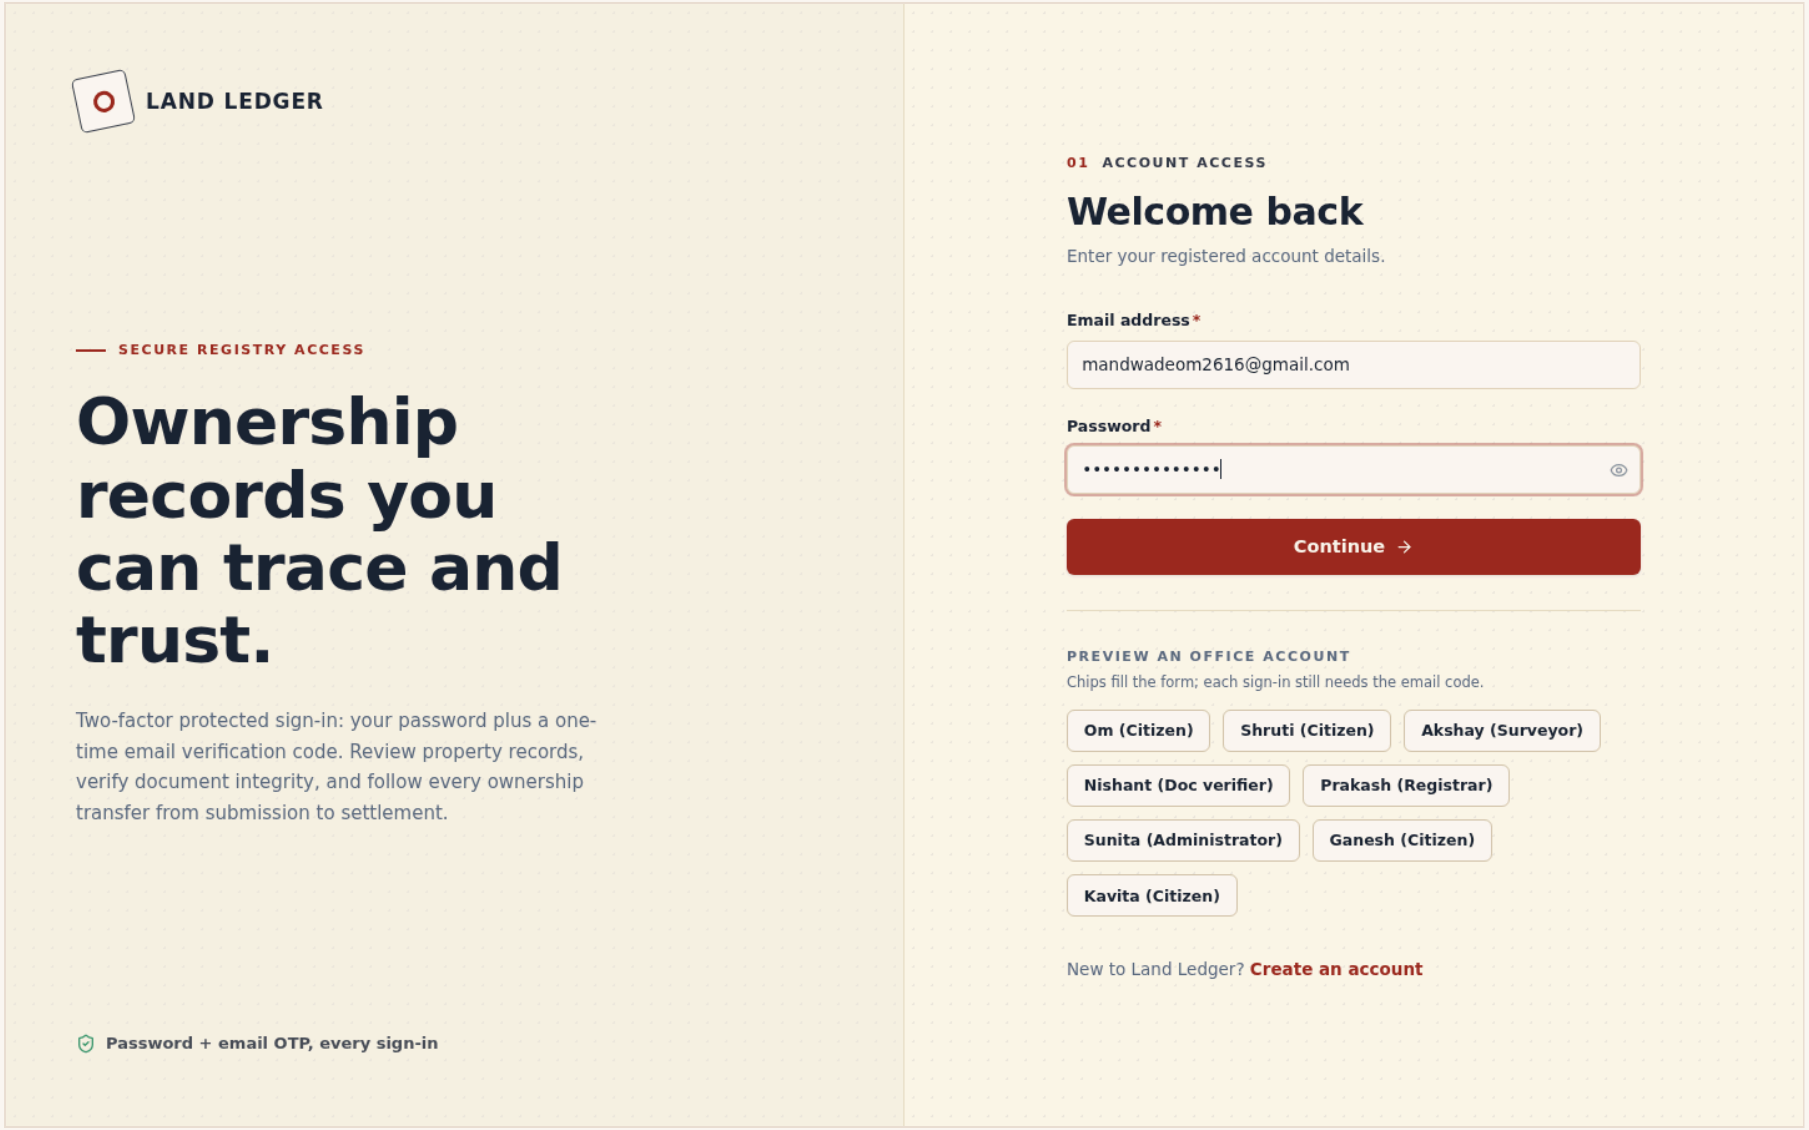

The gate: sign-in and MFA

02

Every account - citizen or officer - passes the same gate: a password plus a six-digit code delivered to a real inbox over live SMTP. The whole scene takes twenty seconds to demo and instantly separates this platform from a mockup. In the companion recording, the code is typed on camera.

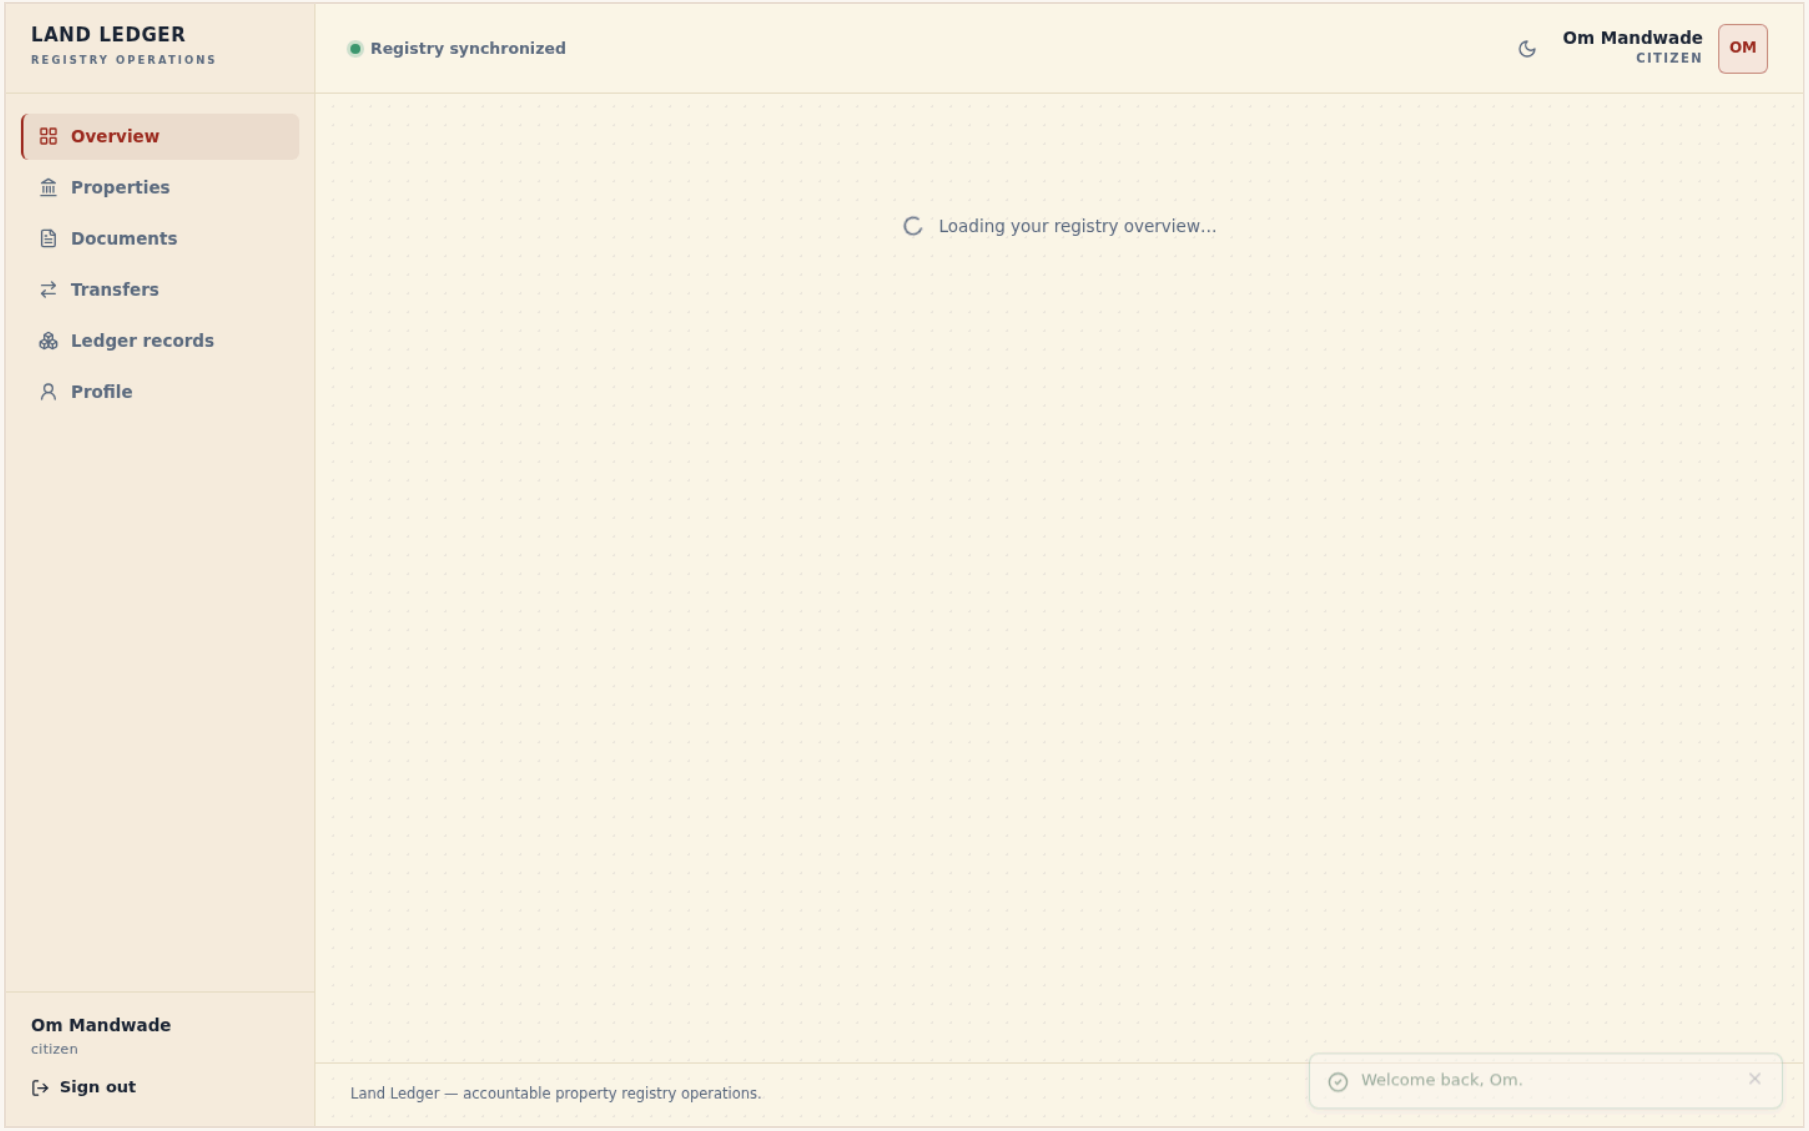

The sign-in screen ships with quick-fill demo account chips - the same eight accounts listed on the final page of this deck. No hunting for credentials mid-demo.

Om Mandwade's credentials are in. Submitting does not open the app yet - it issues a time-boxed challenge to the registered email address.

MFA - the six-digit gate

A six-digit code arrives by real email; the session only opens once it is verified. Two-factor authentication is enforced for every role, not just admins.

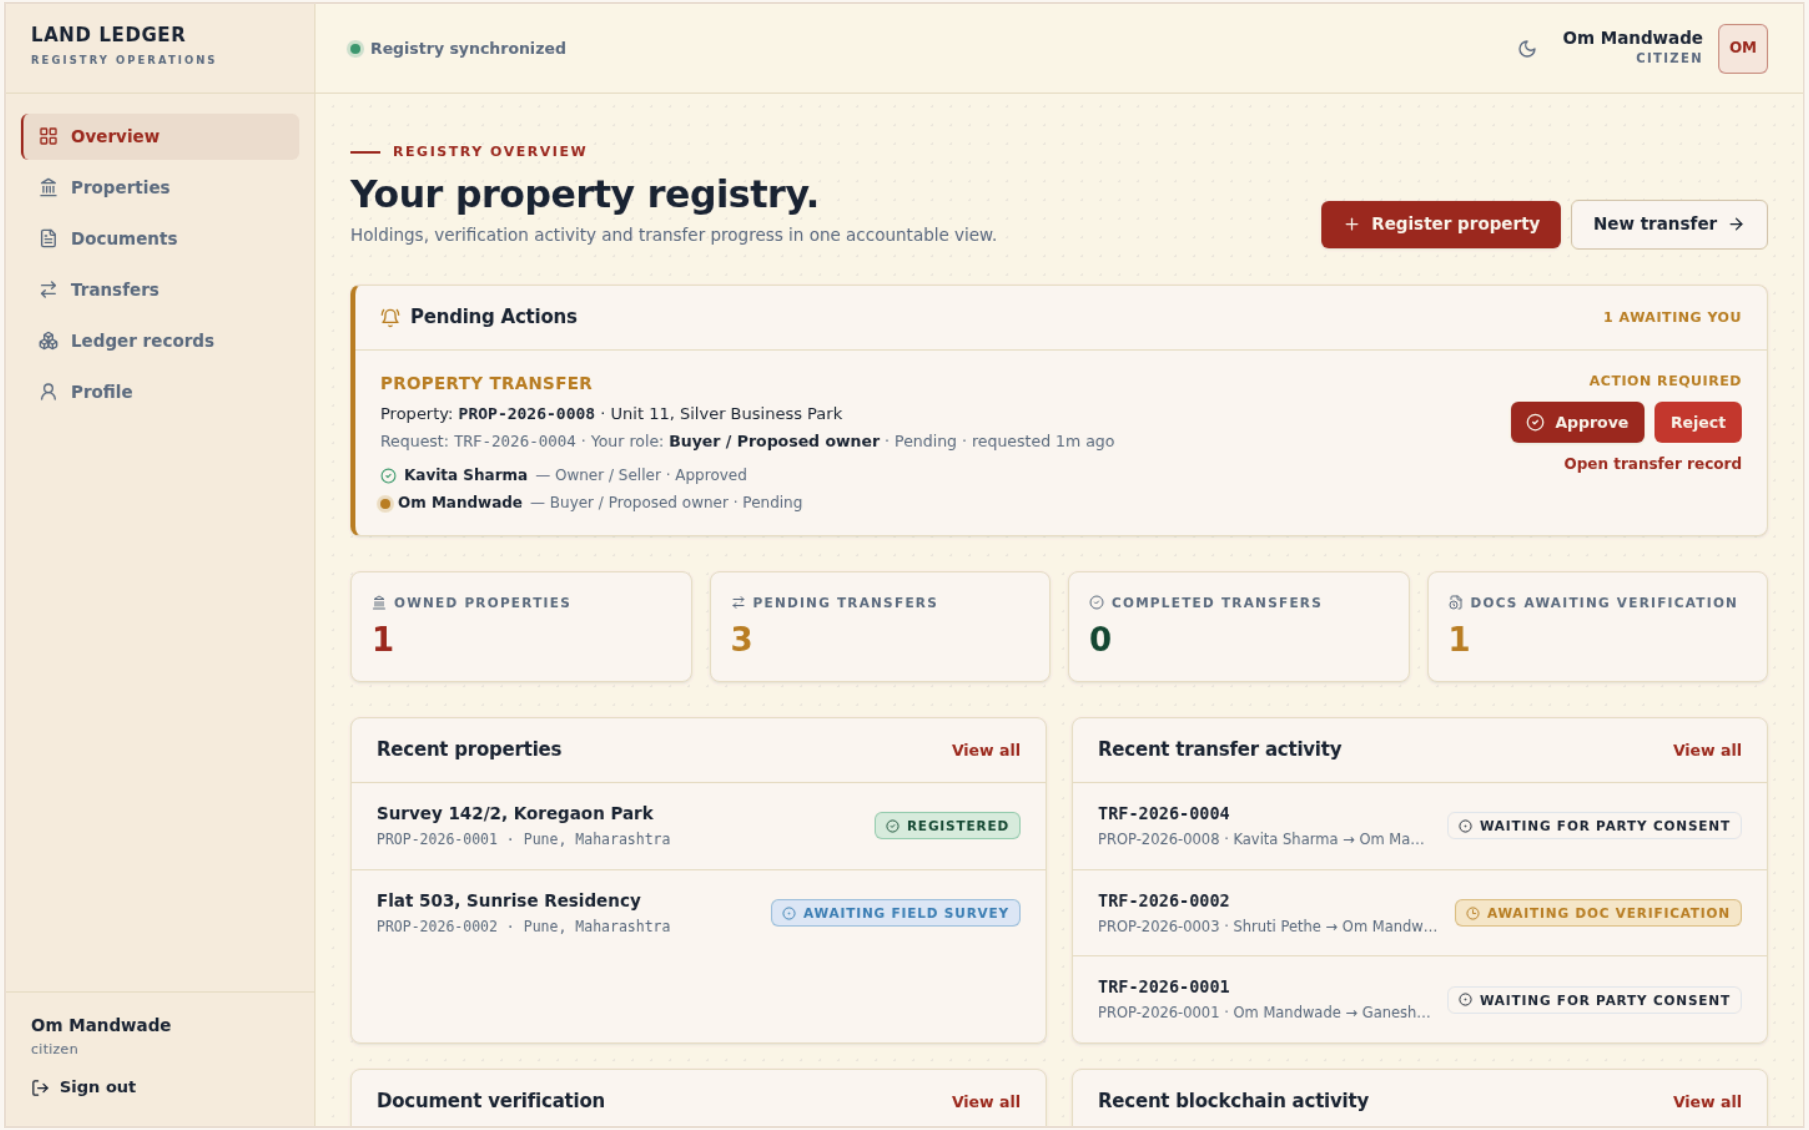

ACT 03 · SCREENS 07-13

The citizen's world

03

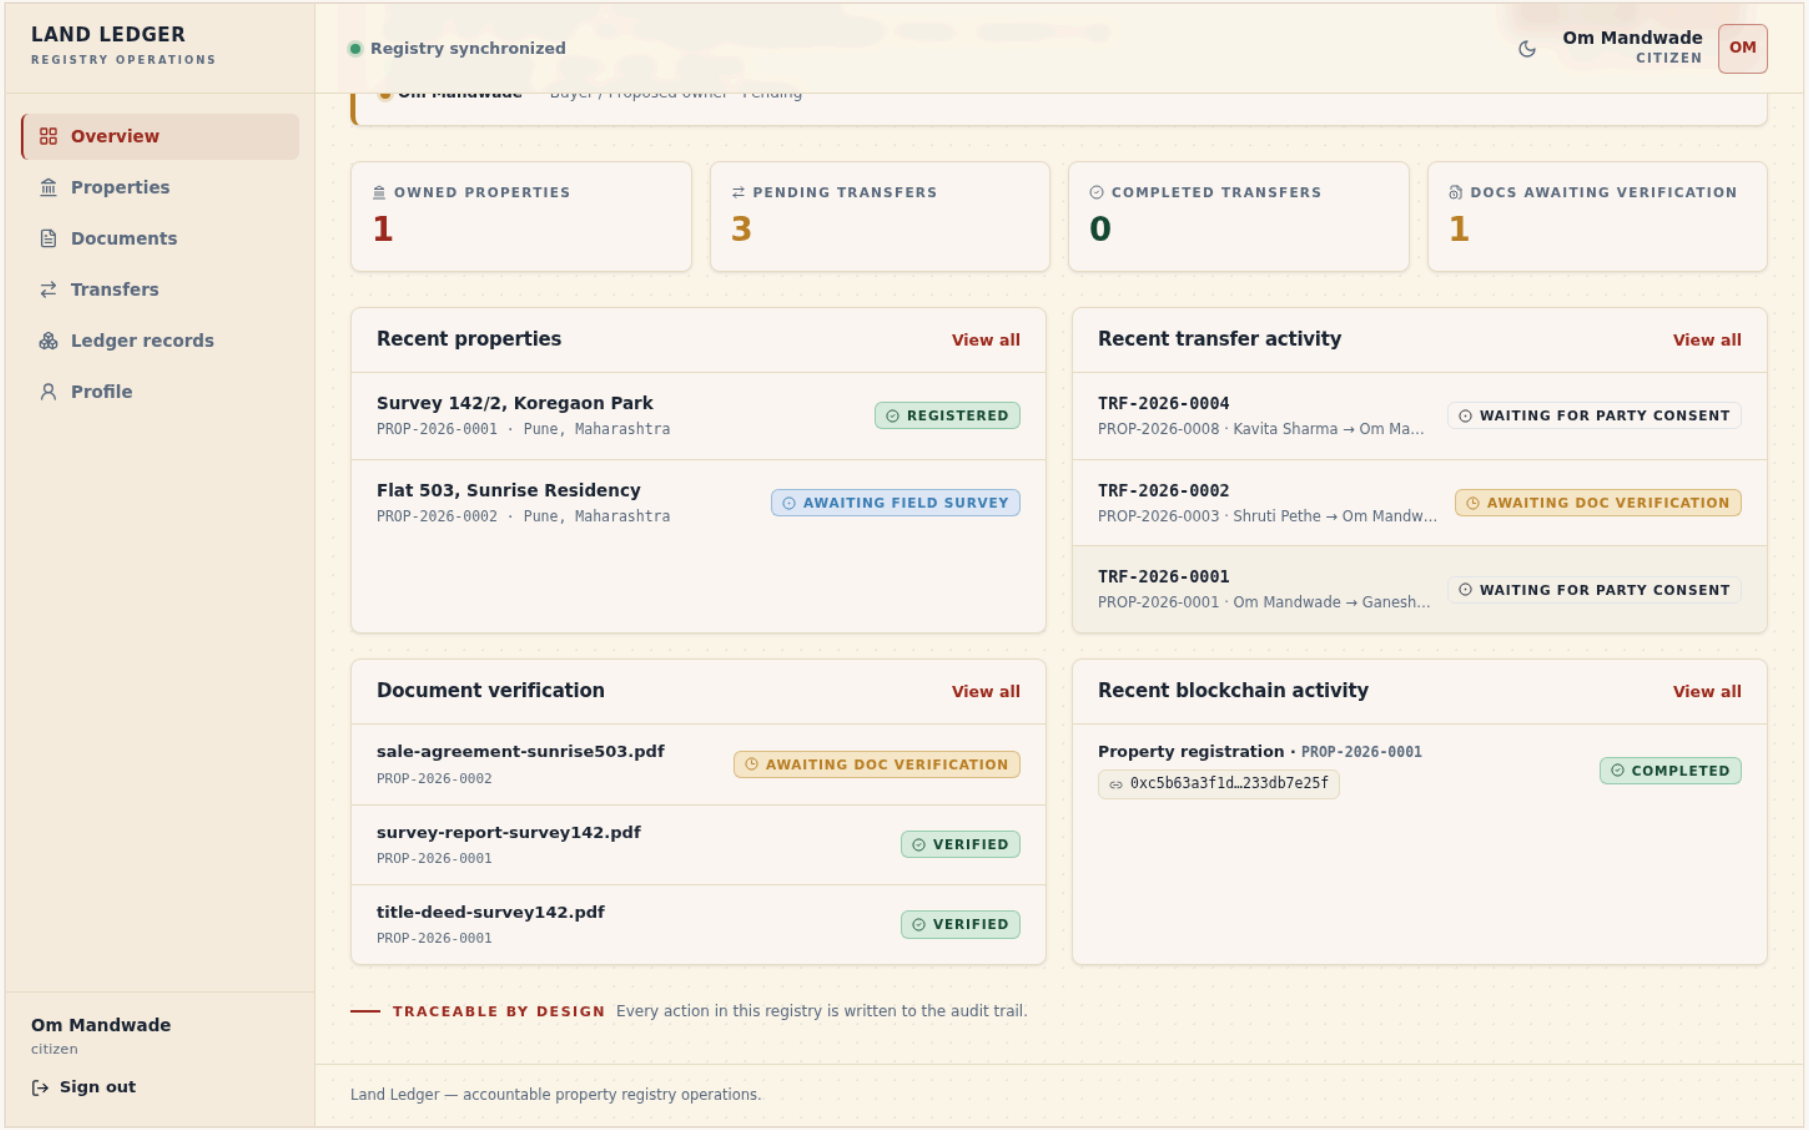

Om Mandwade owns Flat 503 in Sunrise Residency. His world is the citizen app: a dashboard that says what needs attention, a property with its full history, and documents sealed with fingerprints. This act builds the emotional stake before any paperwork starts moving.

Citizen dashboard

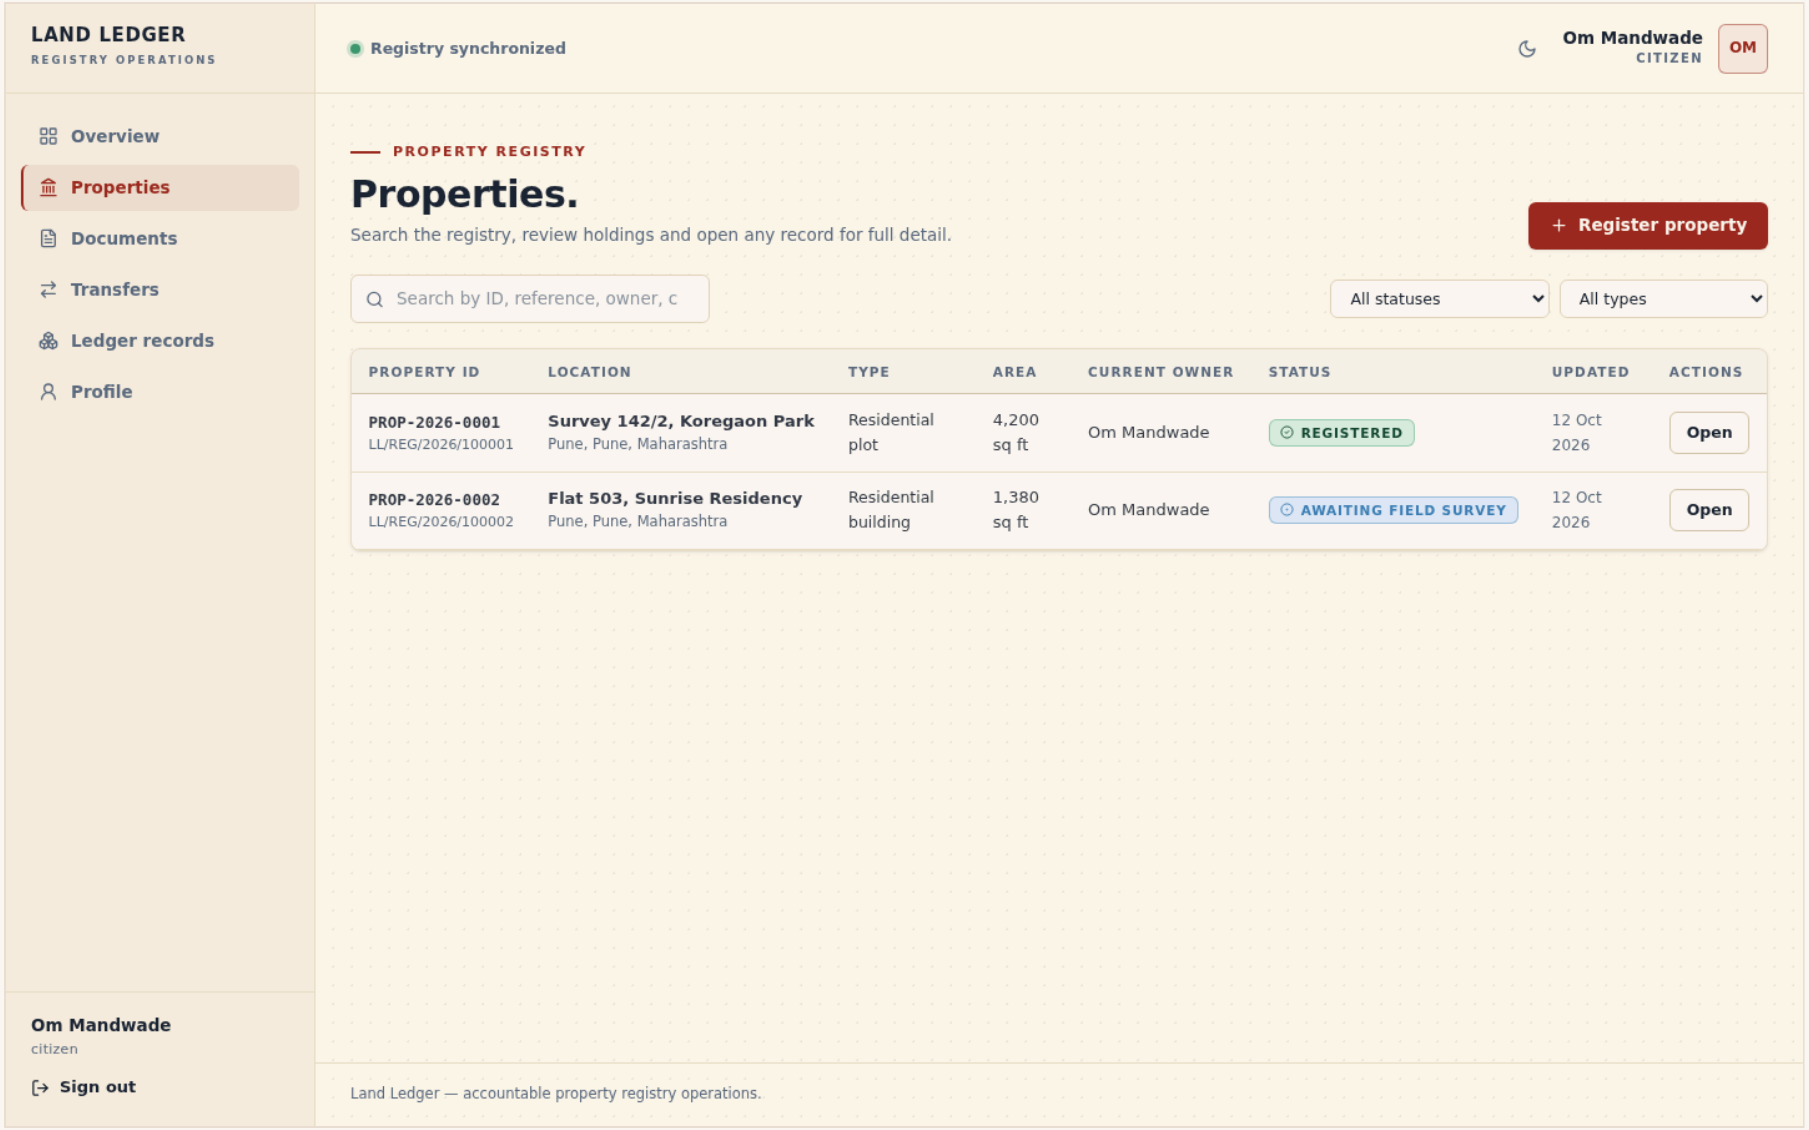

Om lands on a working dashboard, not a placeholder: pending actions, key stats and shortcuts surface immediately, so a citizen always knows the next move.

Dashboard activity

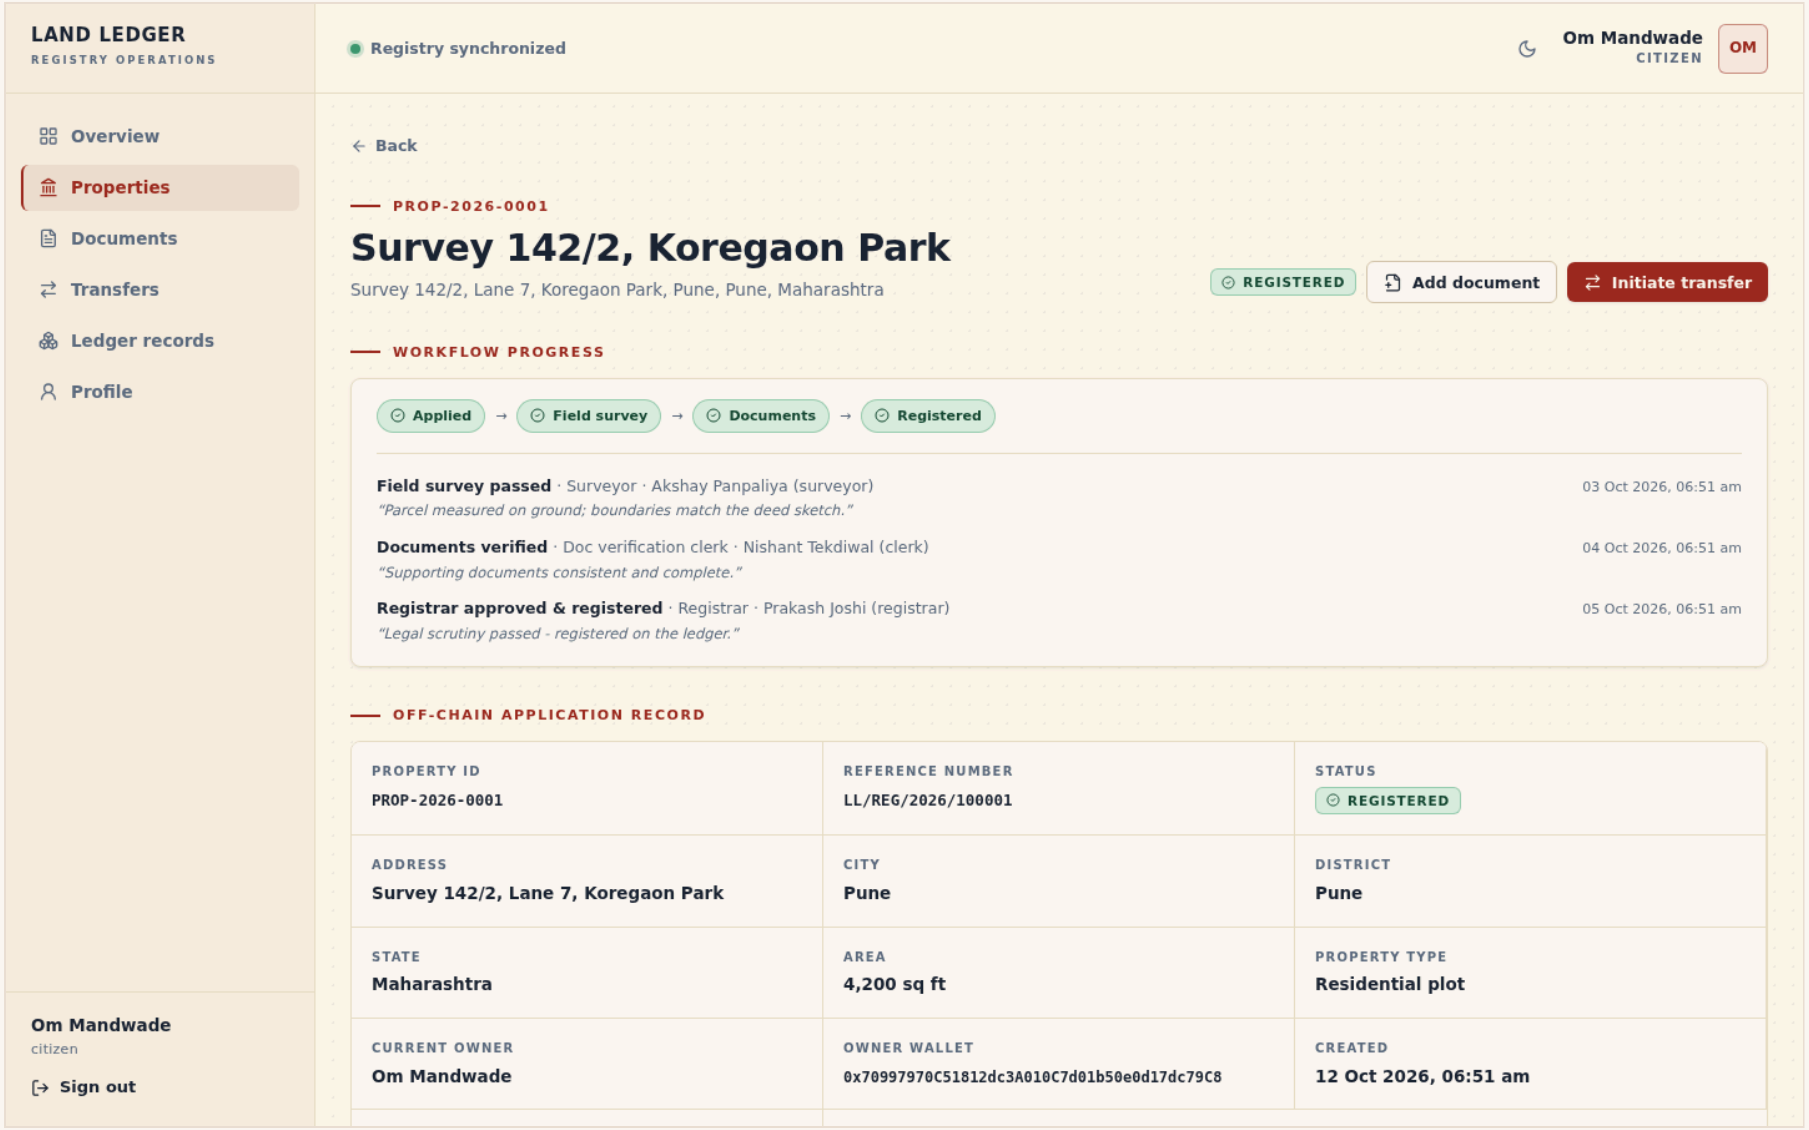

Scrolling down: recent properties, transfer activity and the latest chain events give a live snapshot of everything tied to this account.

Properties list

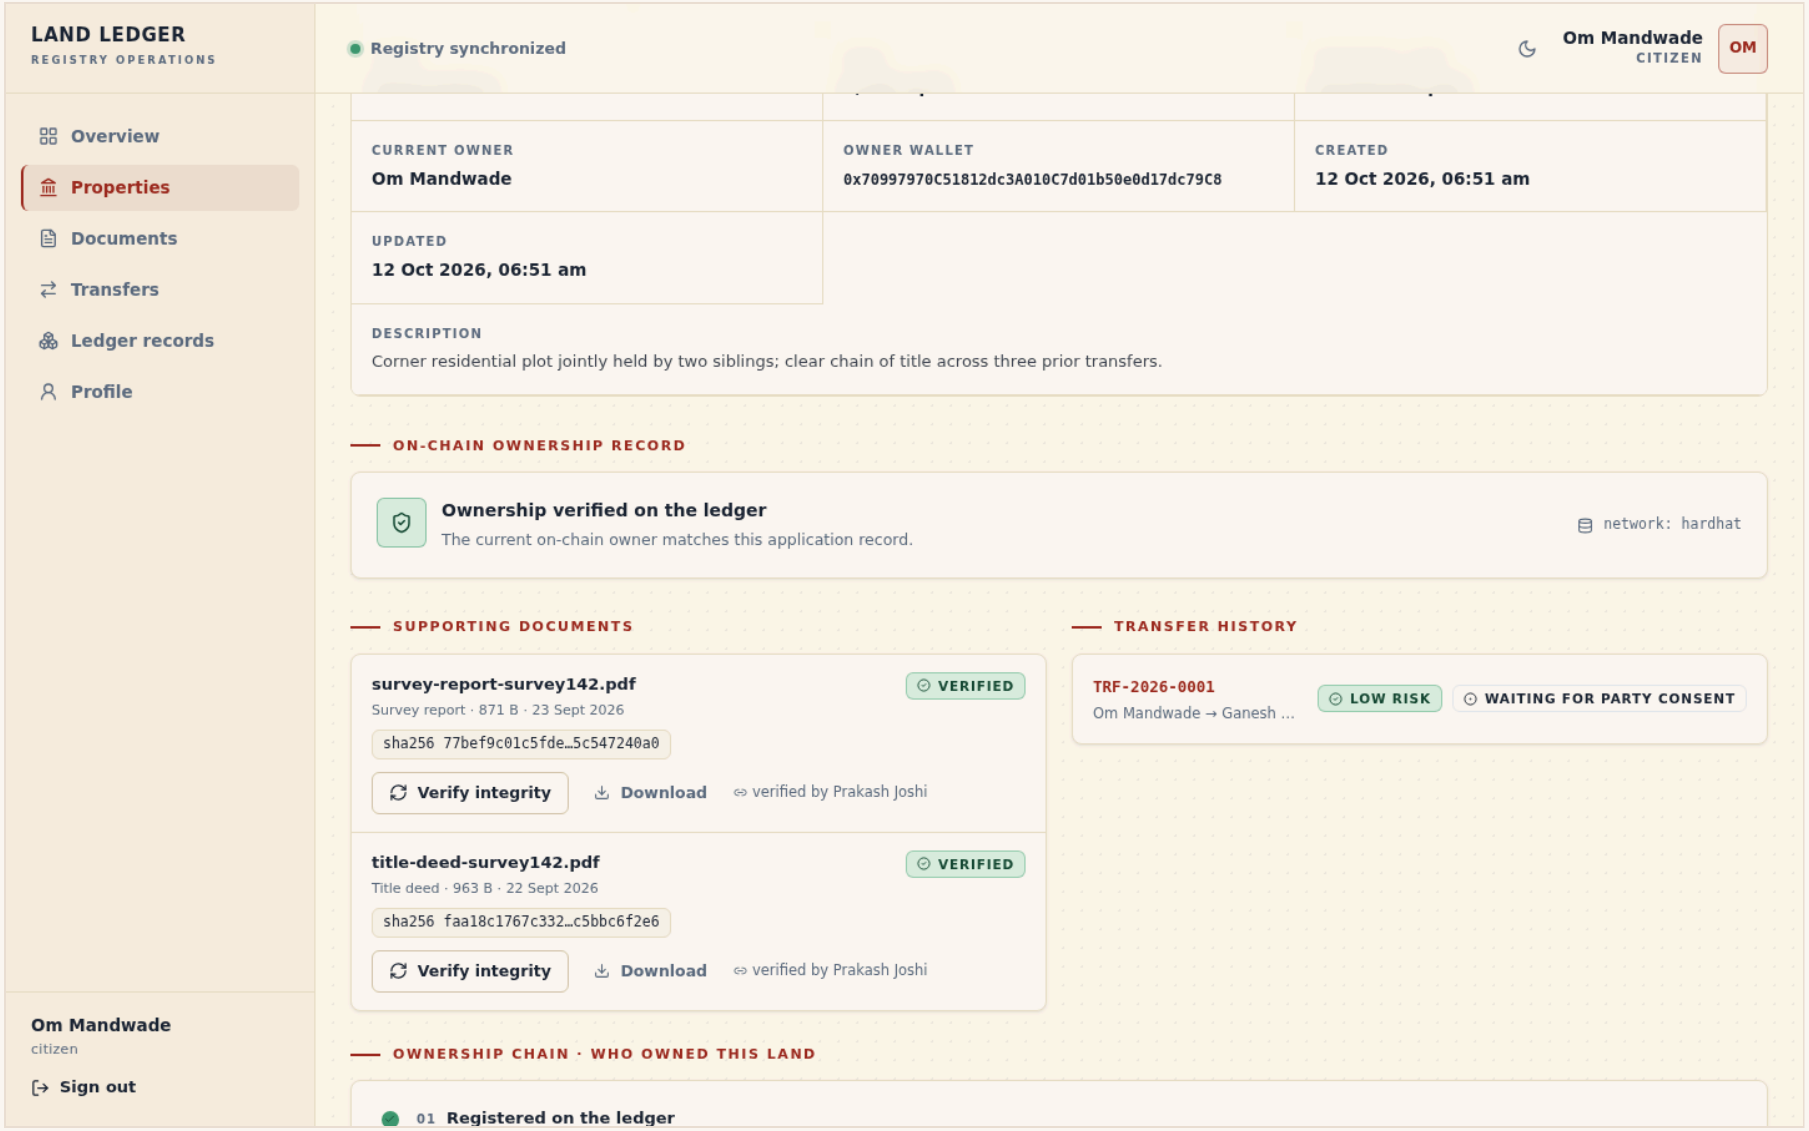

Every parcel this citizen owns or is associated with, with status badges, search and filters. Flat 503 sits here as the star of the demo.

Property detail

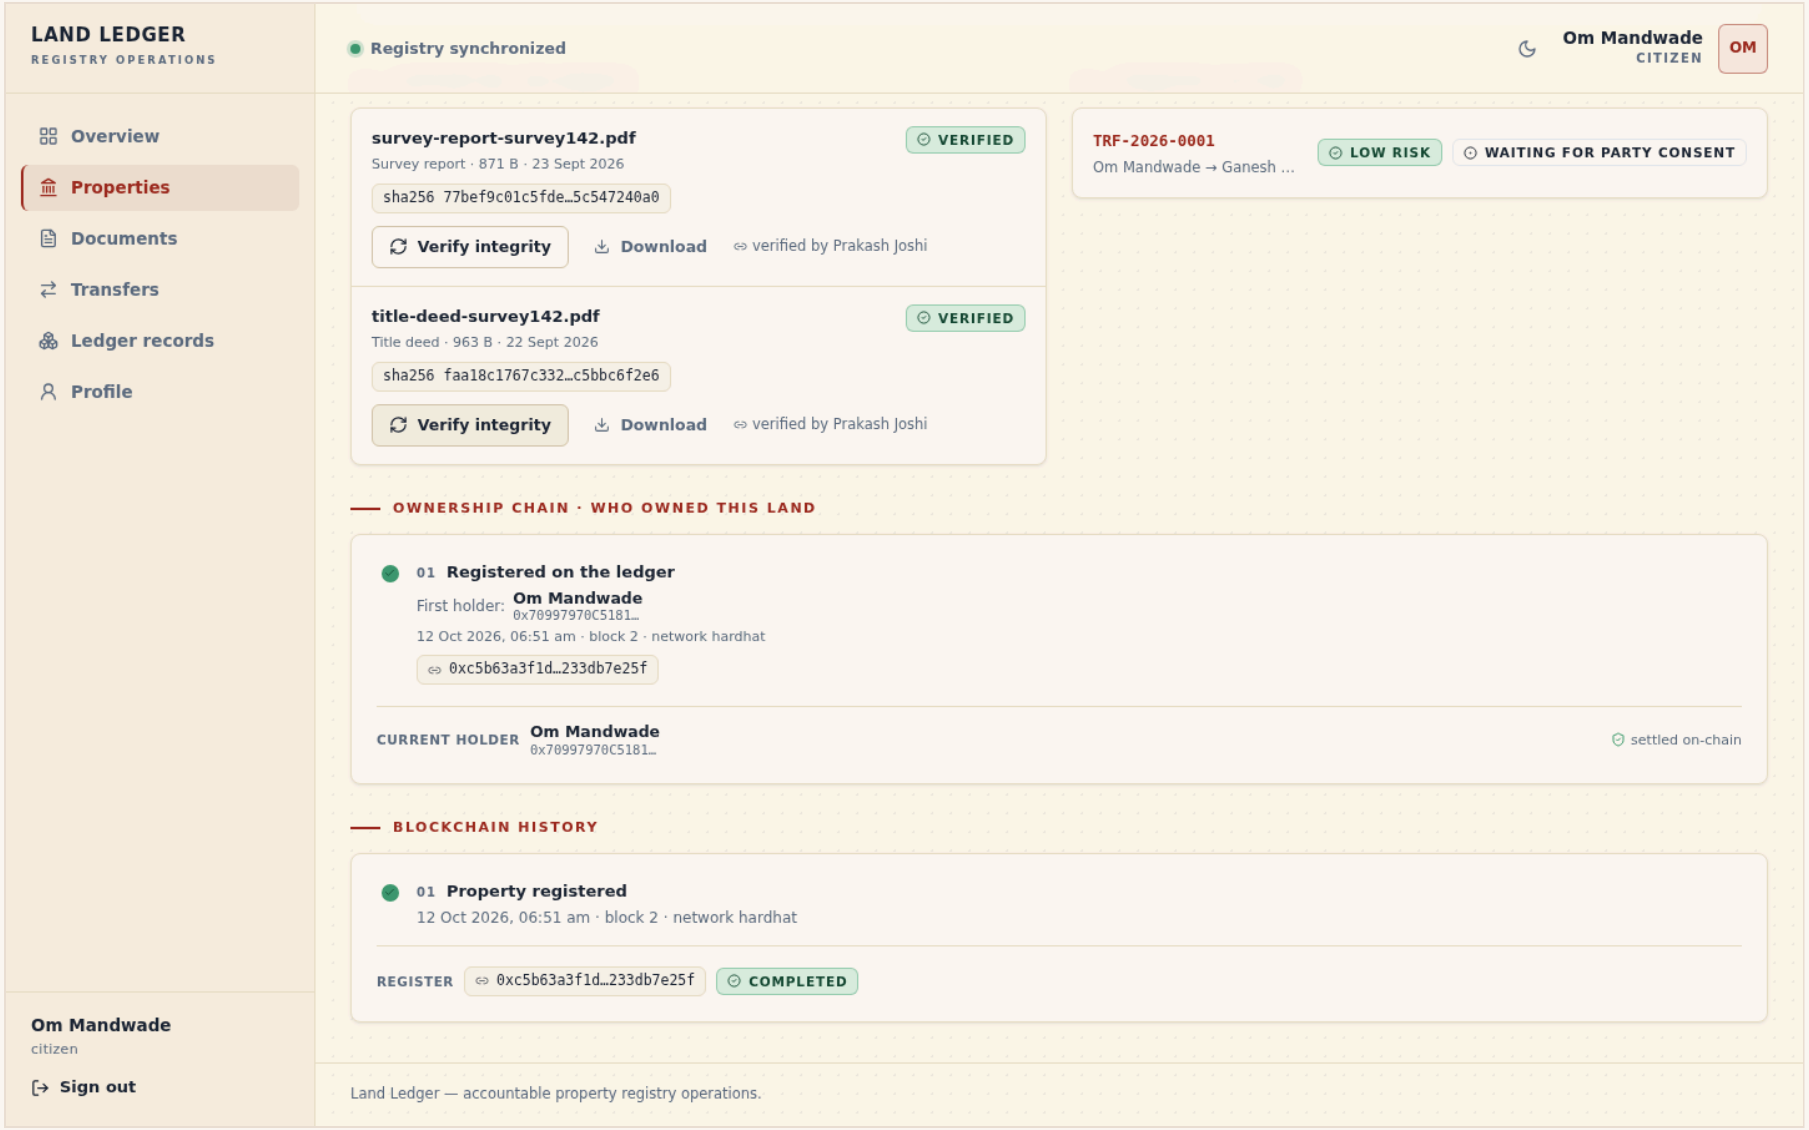

The property file for Flat 503: owner card, survey data, location and the on-chain record anchored when the property was registered.

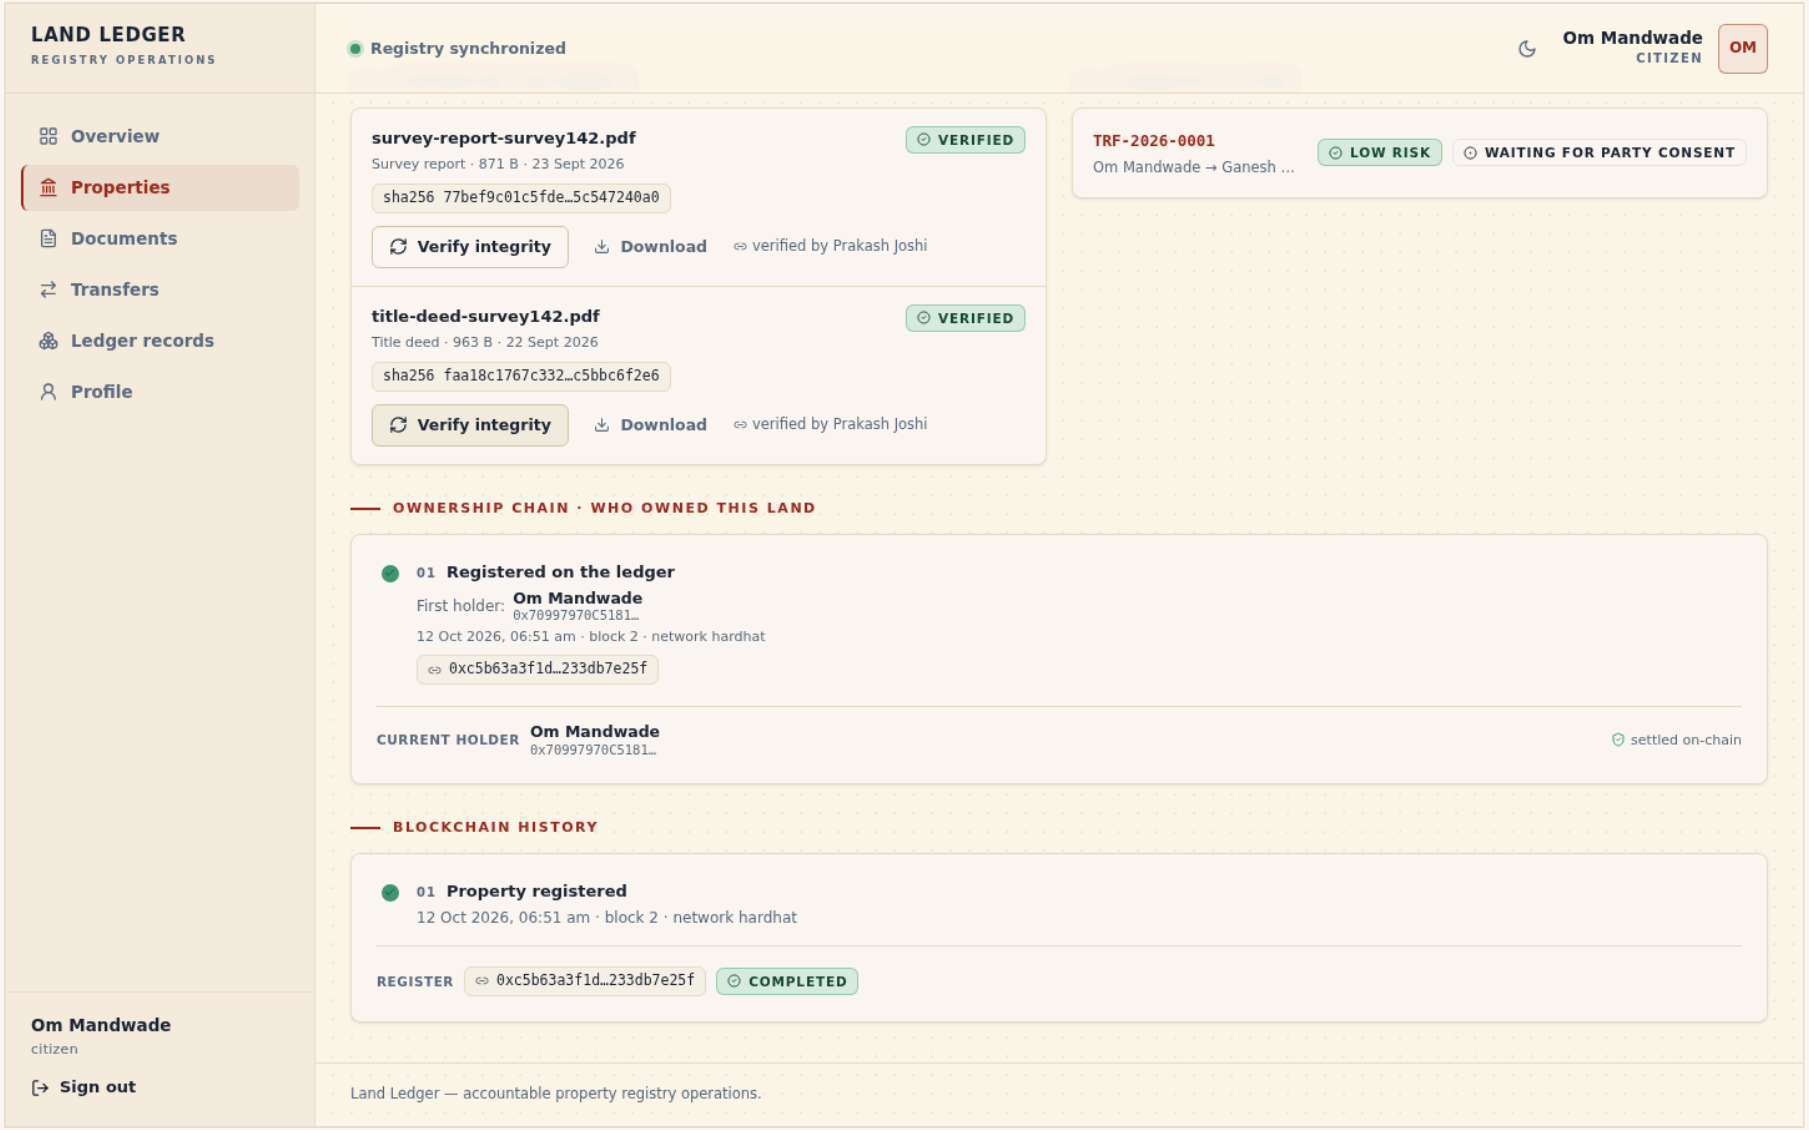

The ownership chain reconstructs the land's full history from ledger events - first holder, every transfer since, and the current owner. Provenance you can read, not trust.

Stage timeline

The stage timeline shows exactly who acted, when, and what note they left. The process is visible to the citizen, not hidden in a back office.

Property documents

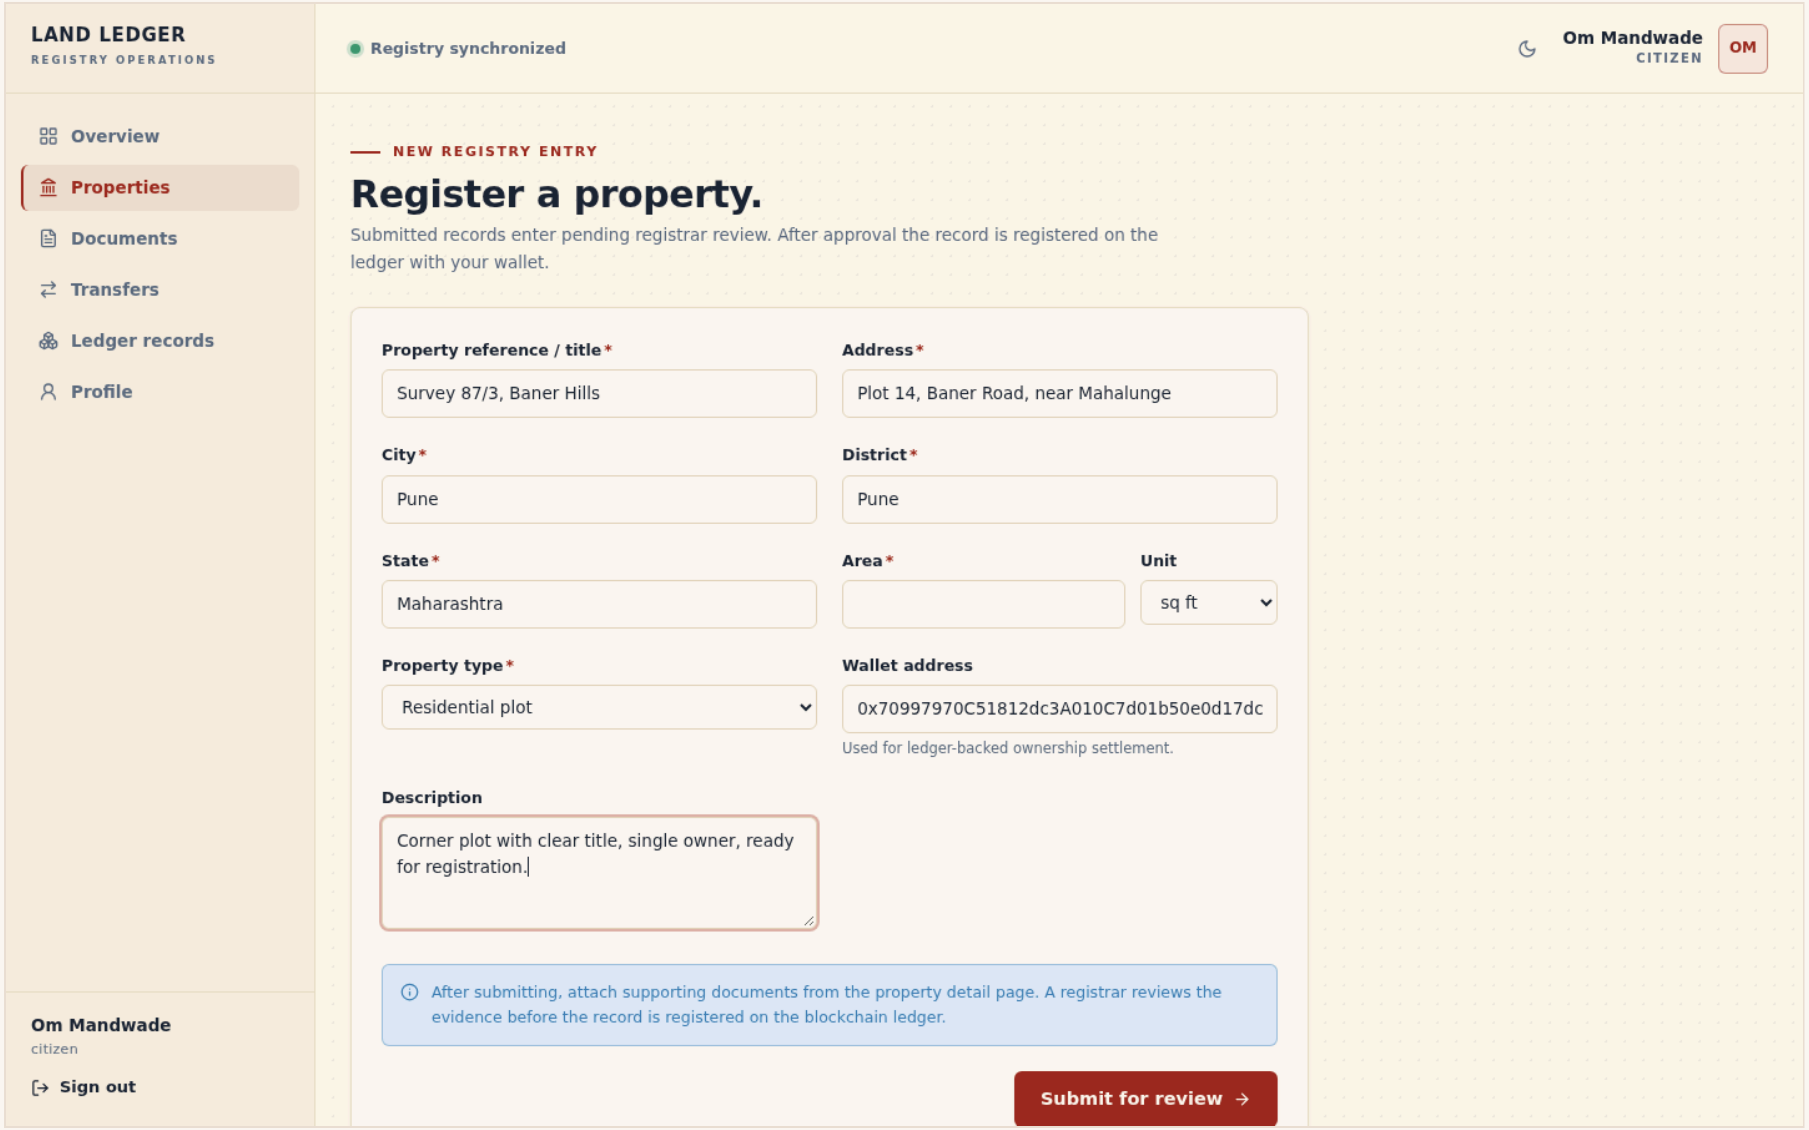

Documents attached to the property carry SHA-256 fingerprints; each file opens or downloads in one click, and office staff verify the same bytes later.

ACT 04 · SCREENS 14-22

Citizen workflows

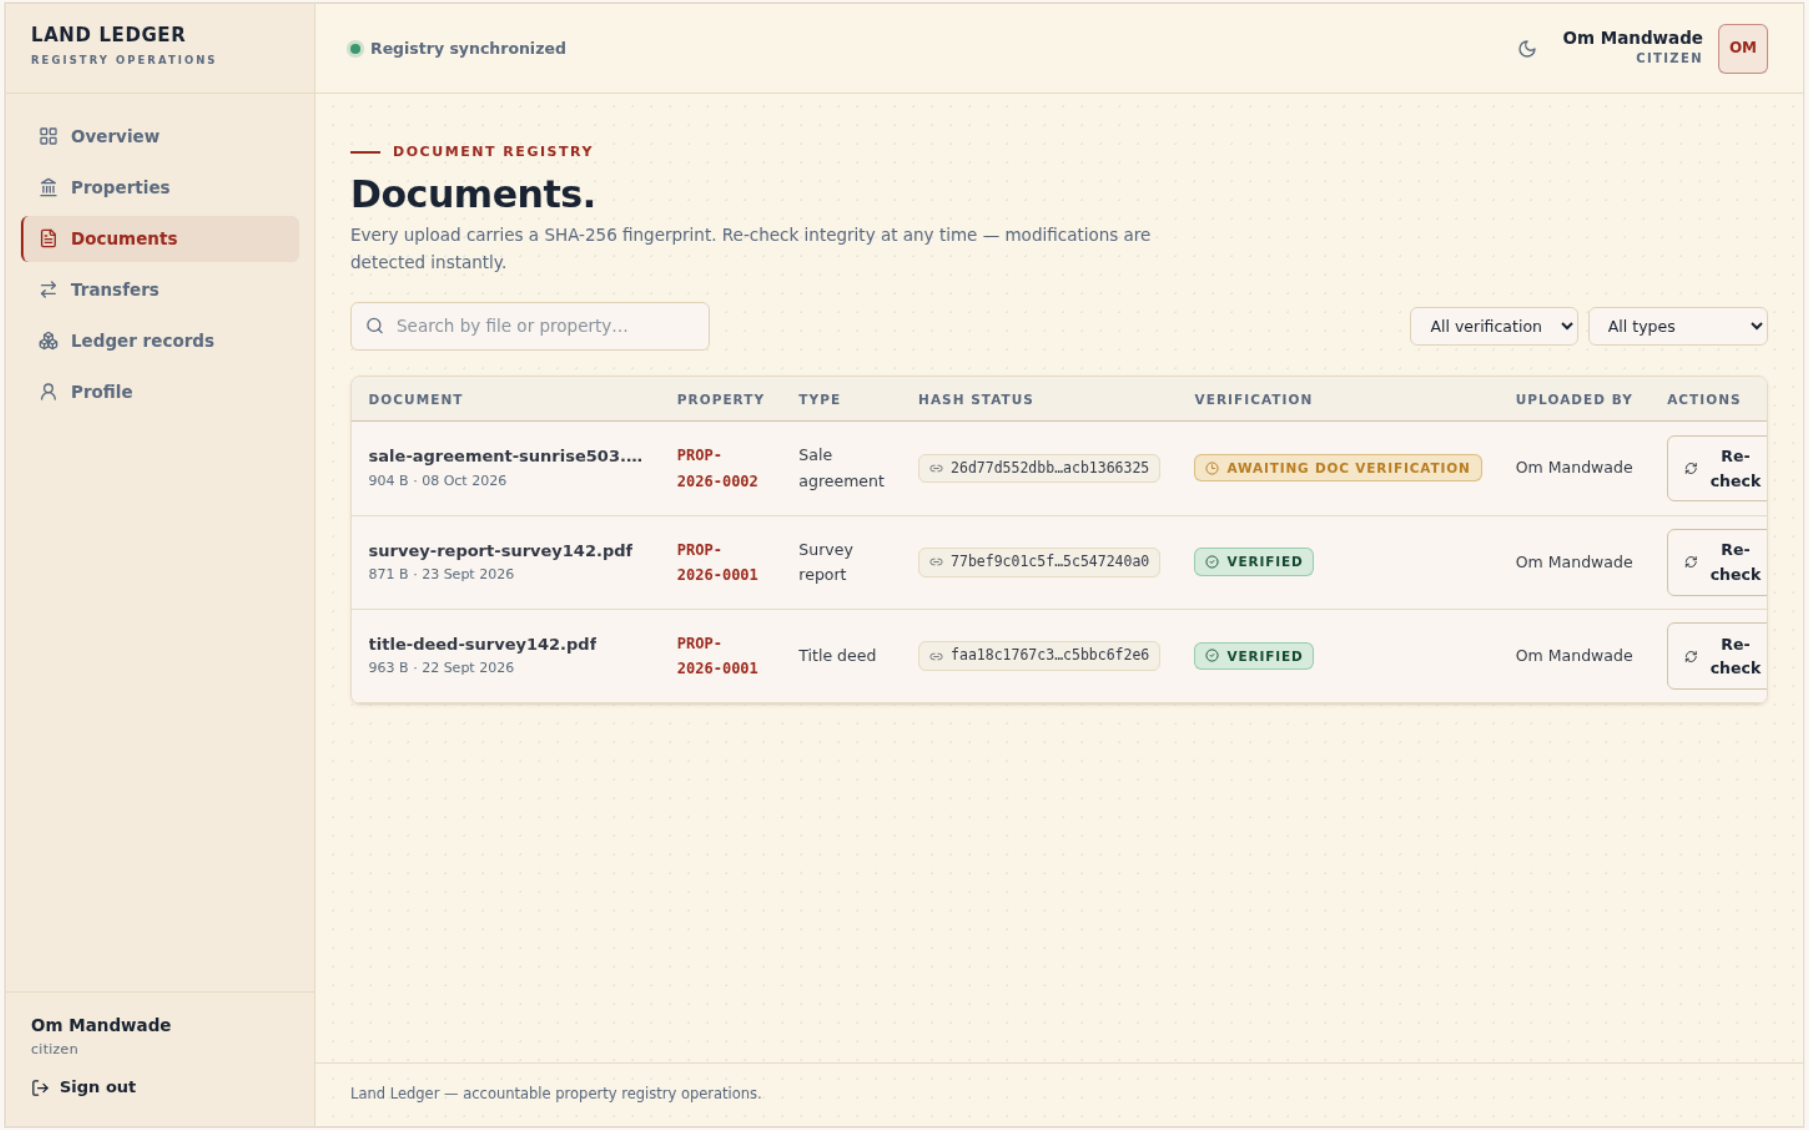

04

Here the citizen does real work: registering property, managing documents and - the heart of this demo - initiating the transfer of his flat to Ganesh Patil. Transfer TRF-2026-0001 is the case we follow for the rest of the deck, and consent from every required party must land before any office touches it.

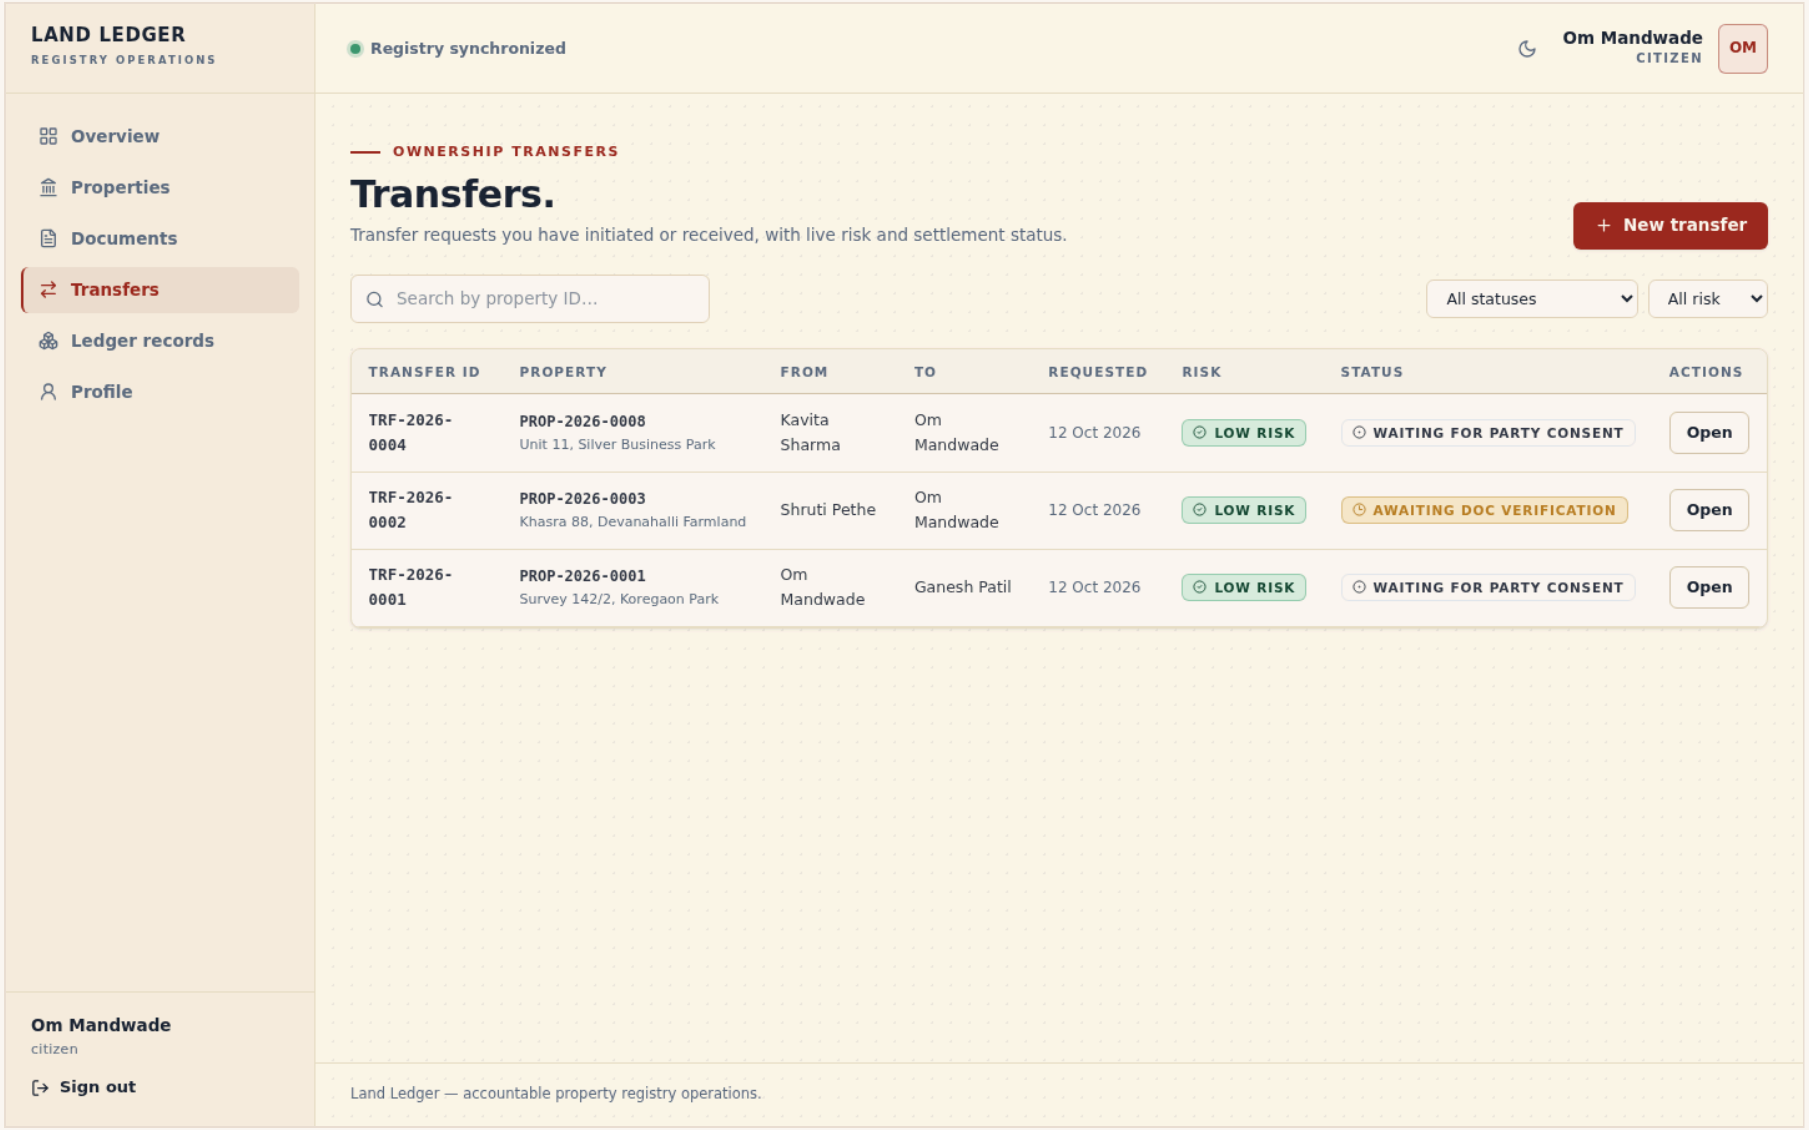

A new property application: location, survey details and supporting documents in one guided form, filled and ready to submit. This is how land enters the registry.

Document vault

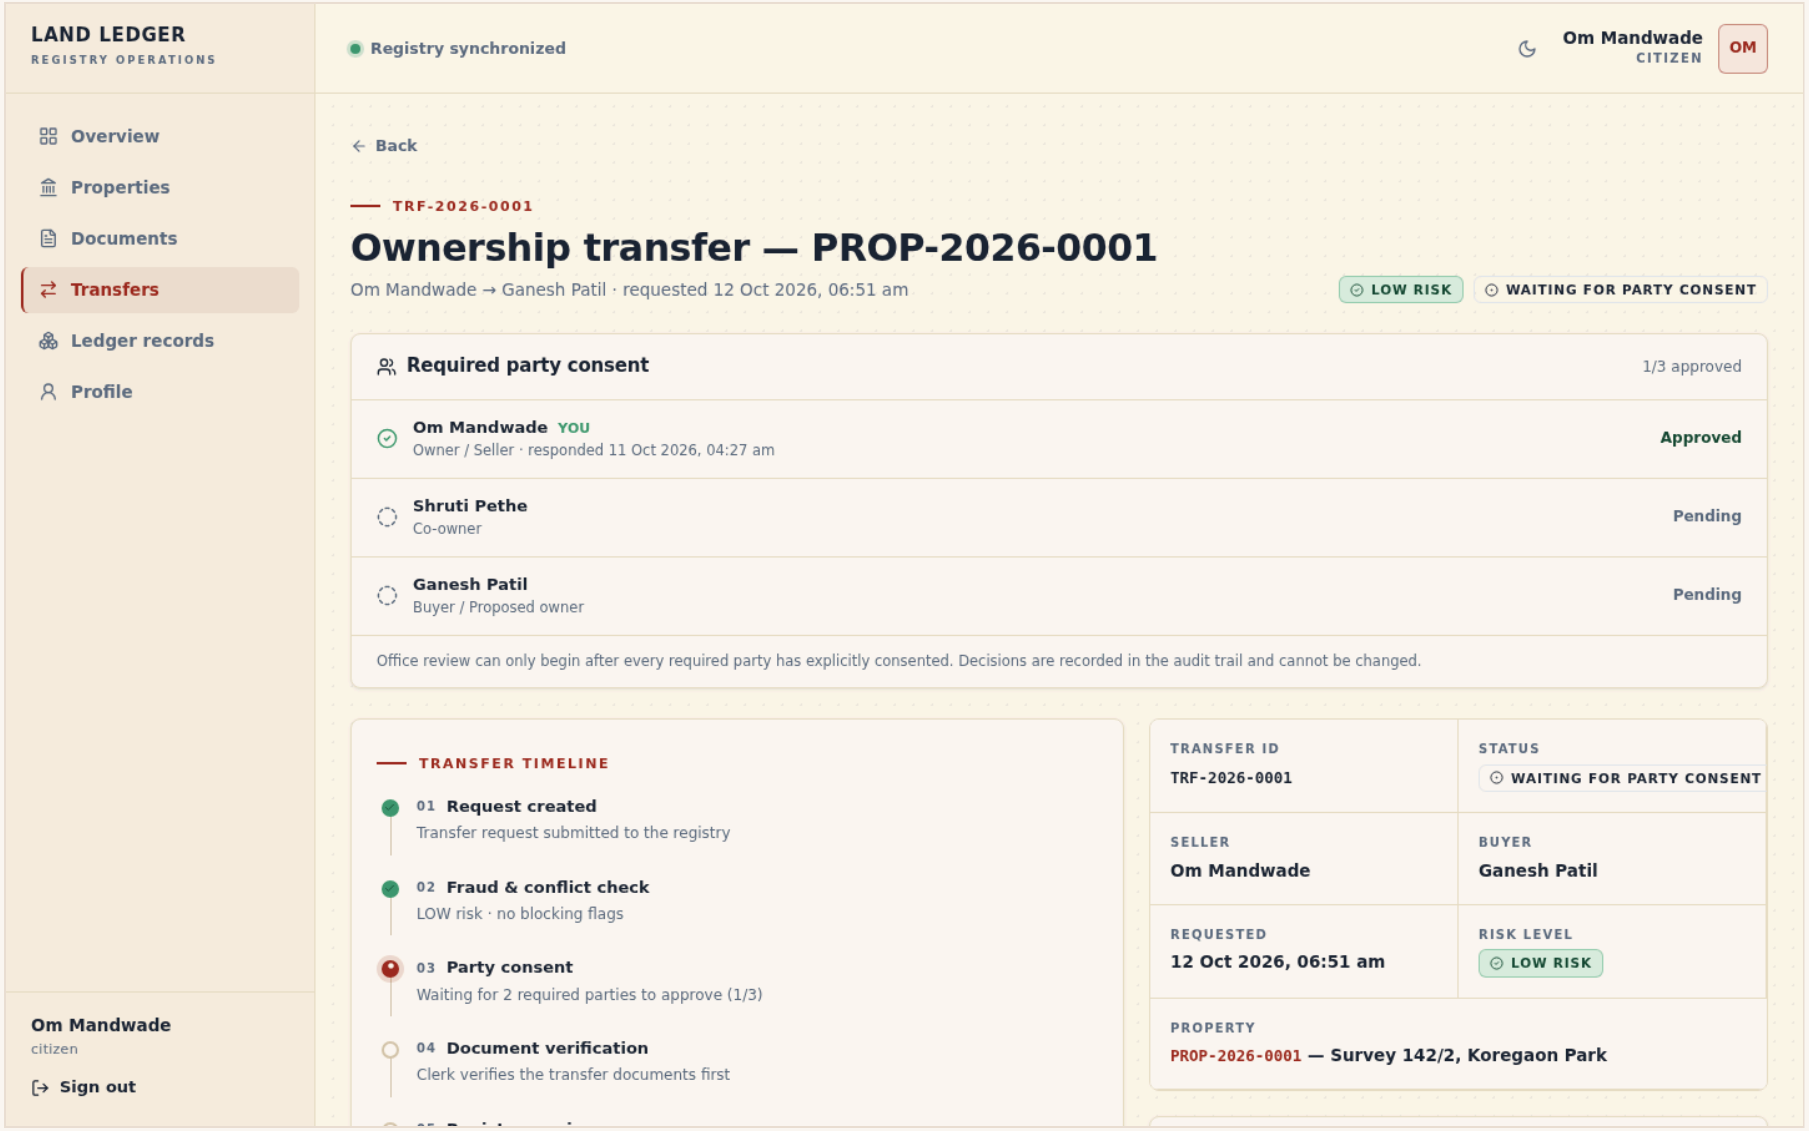

The citizen's vault: every uploaded file with its hash, type and status - the same bytes the clerk will hash-check later in Act 8.

The transfers list, with TRF-2026-0001 waiting on buyer consent - the live case this demo follows end to end.

Transfer TRF-2026-0001

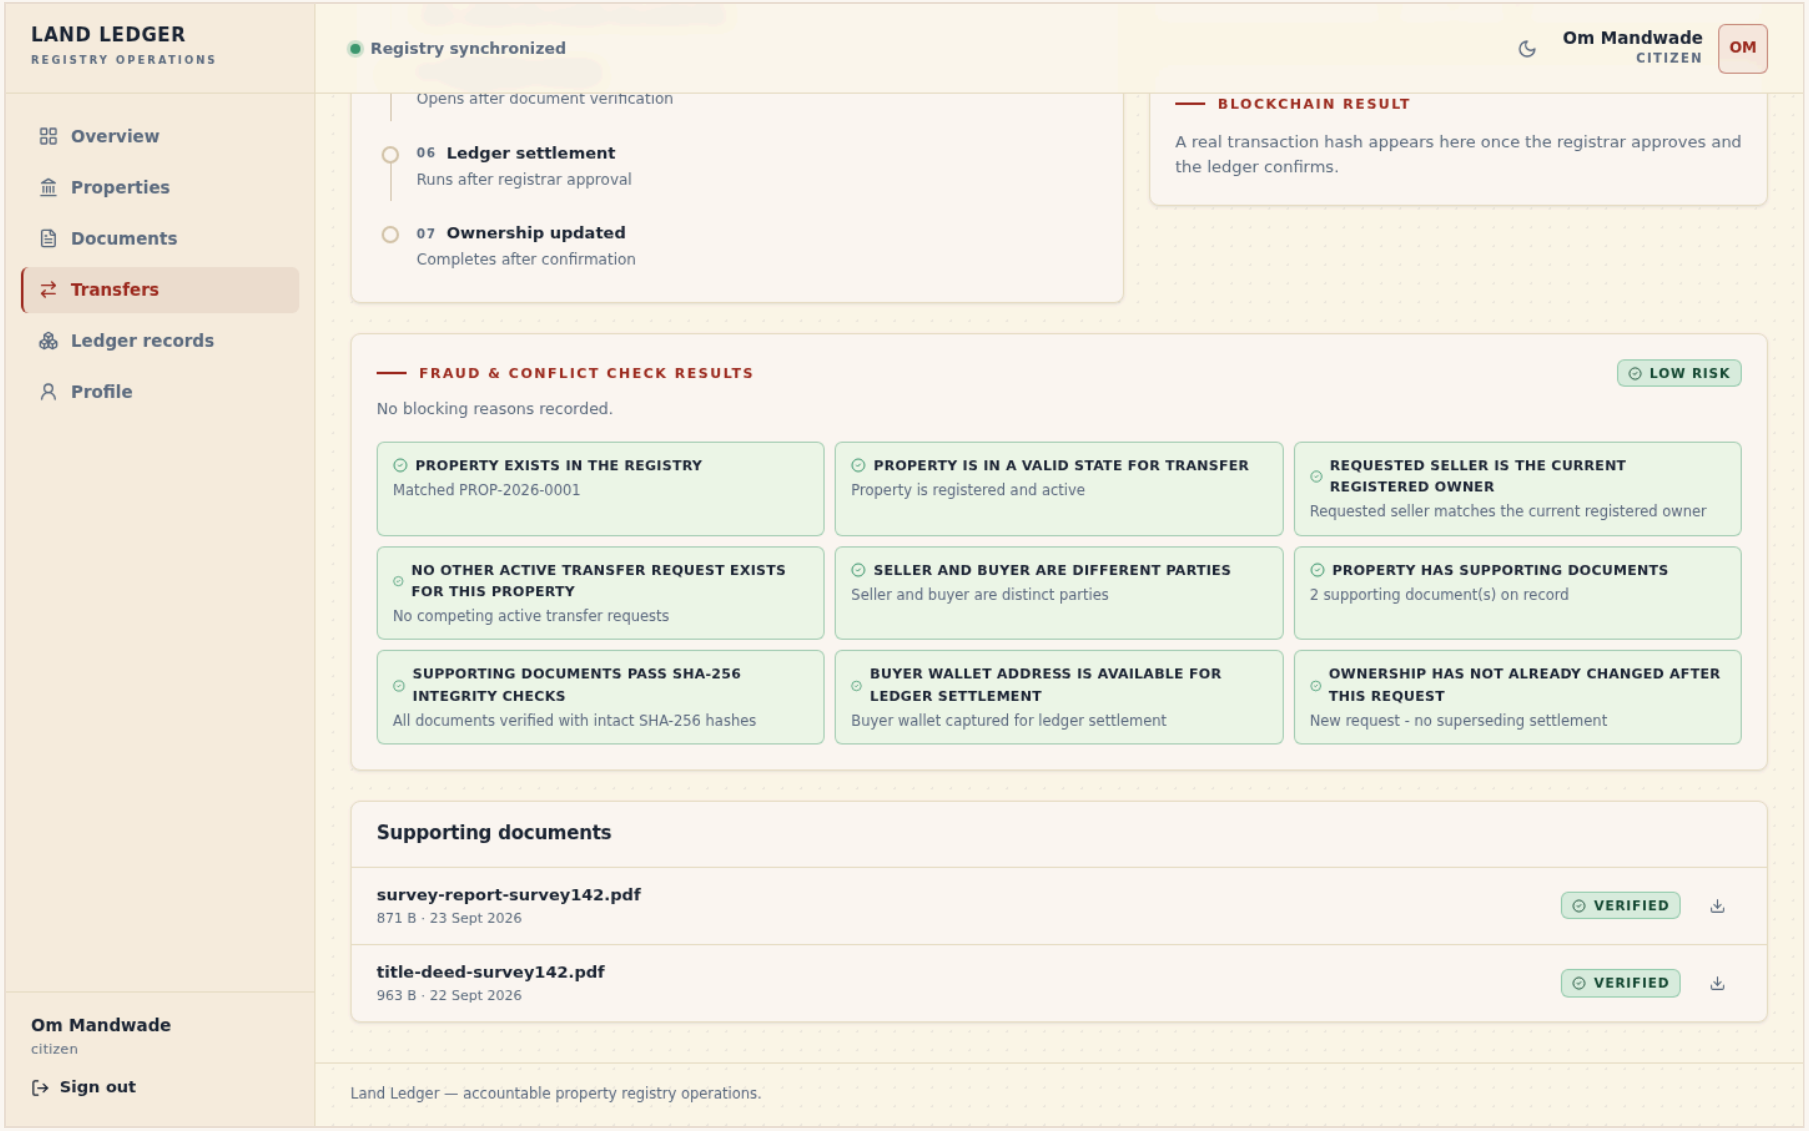

The transfer file: seller, buyer, the property being sold, and the consent of every required party tracked in one place.

Consent parties

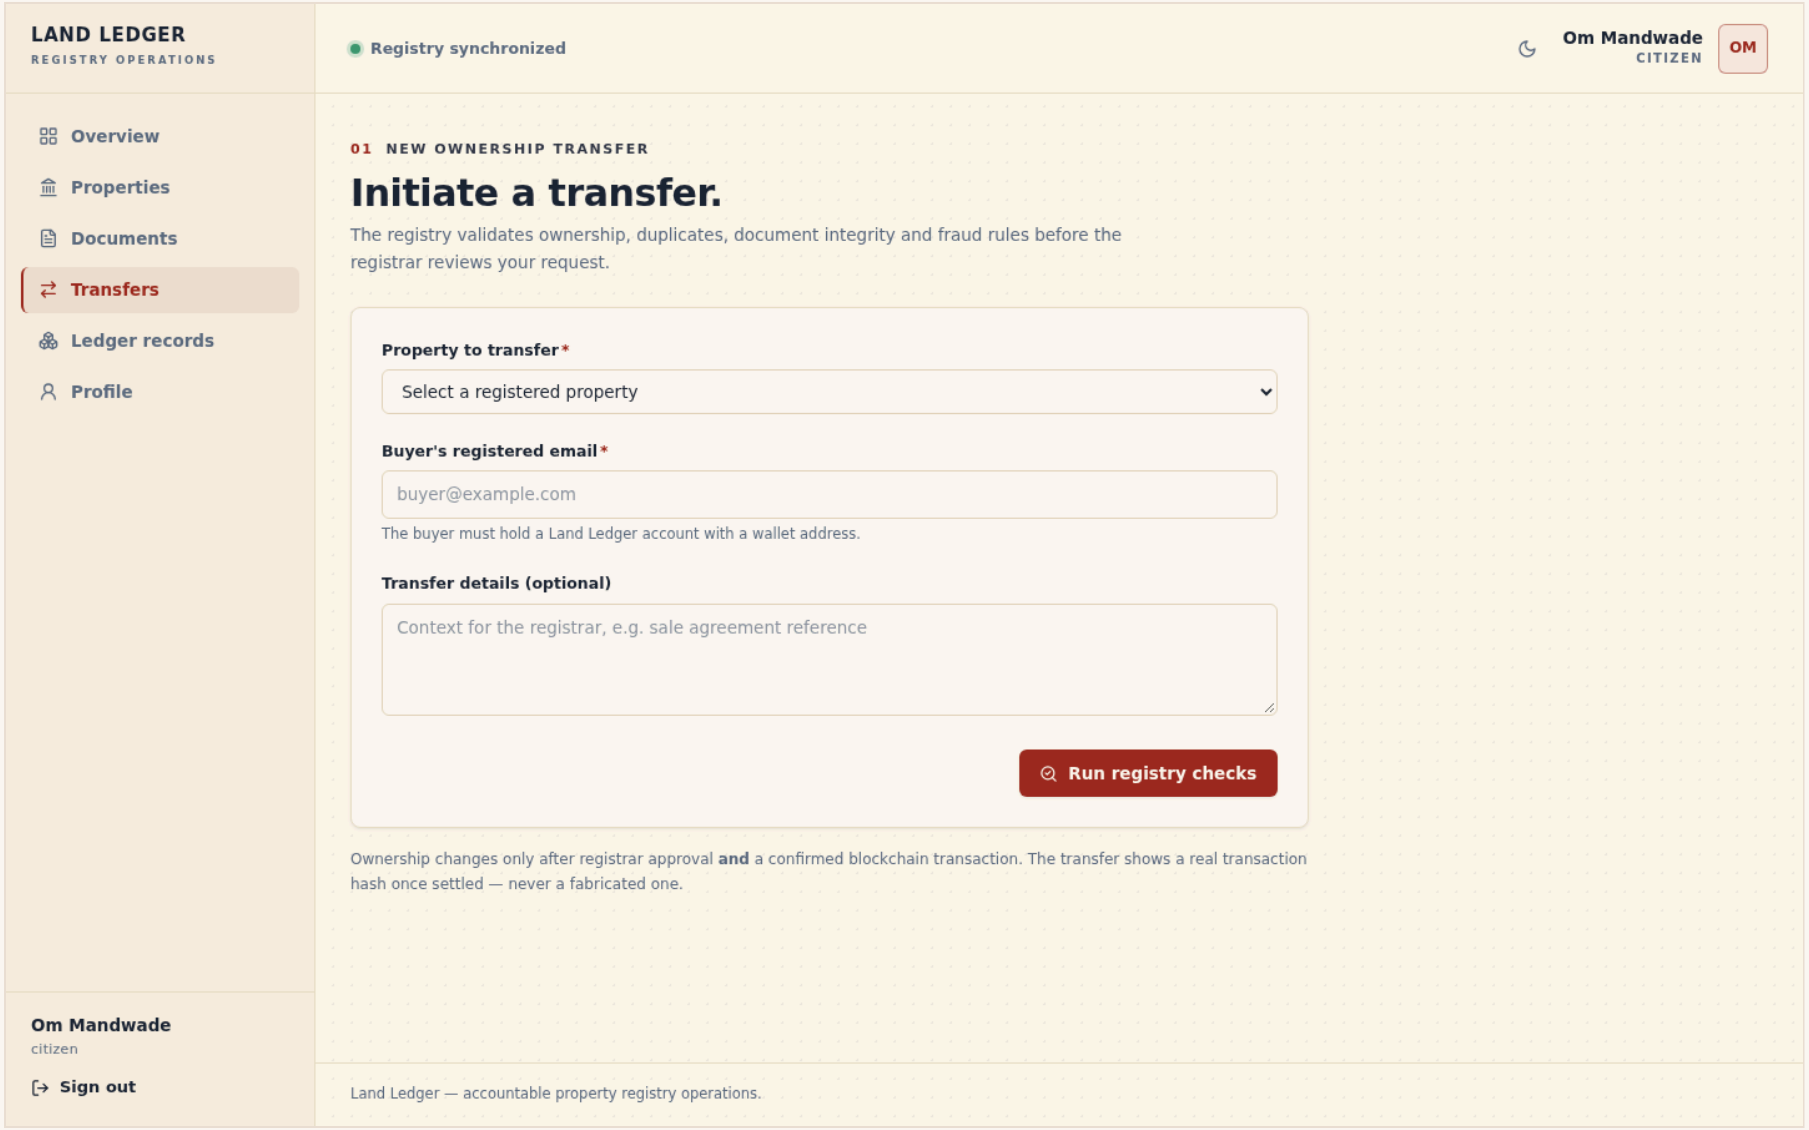

The parties panel zooms in on consent states - who has approved, who is still to act. Nothing advances until every required signature is on file.

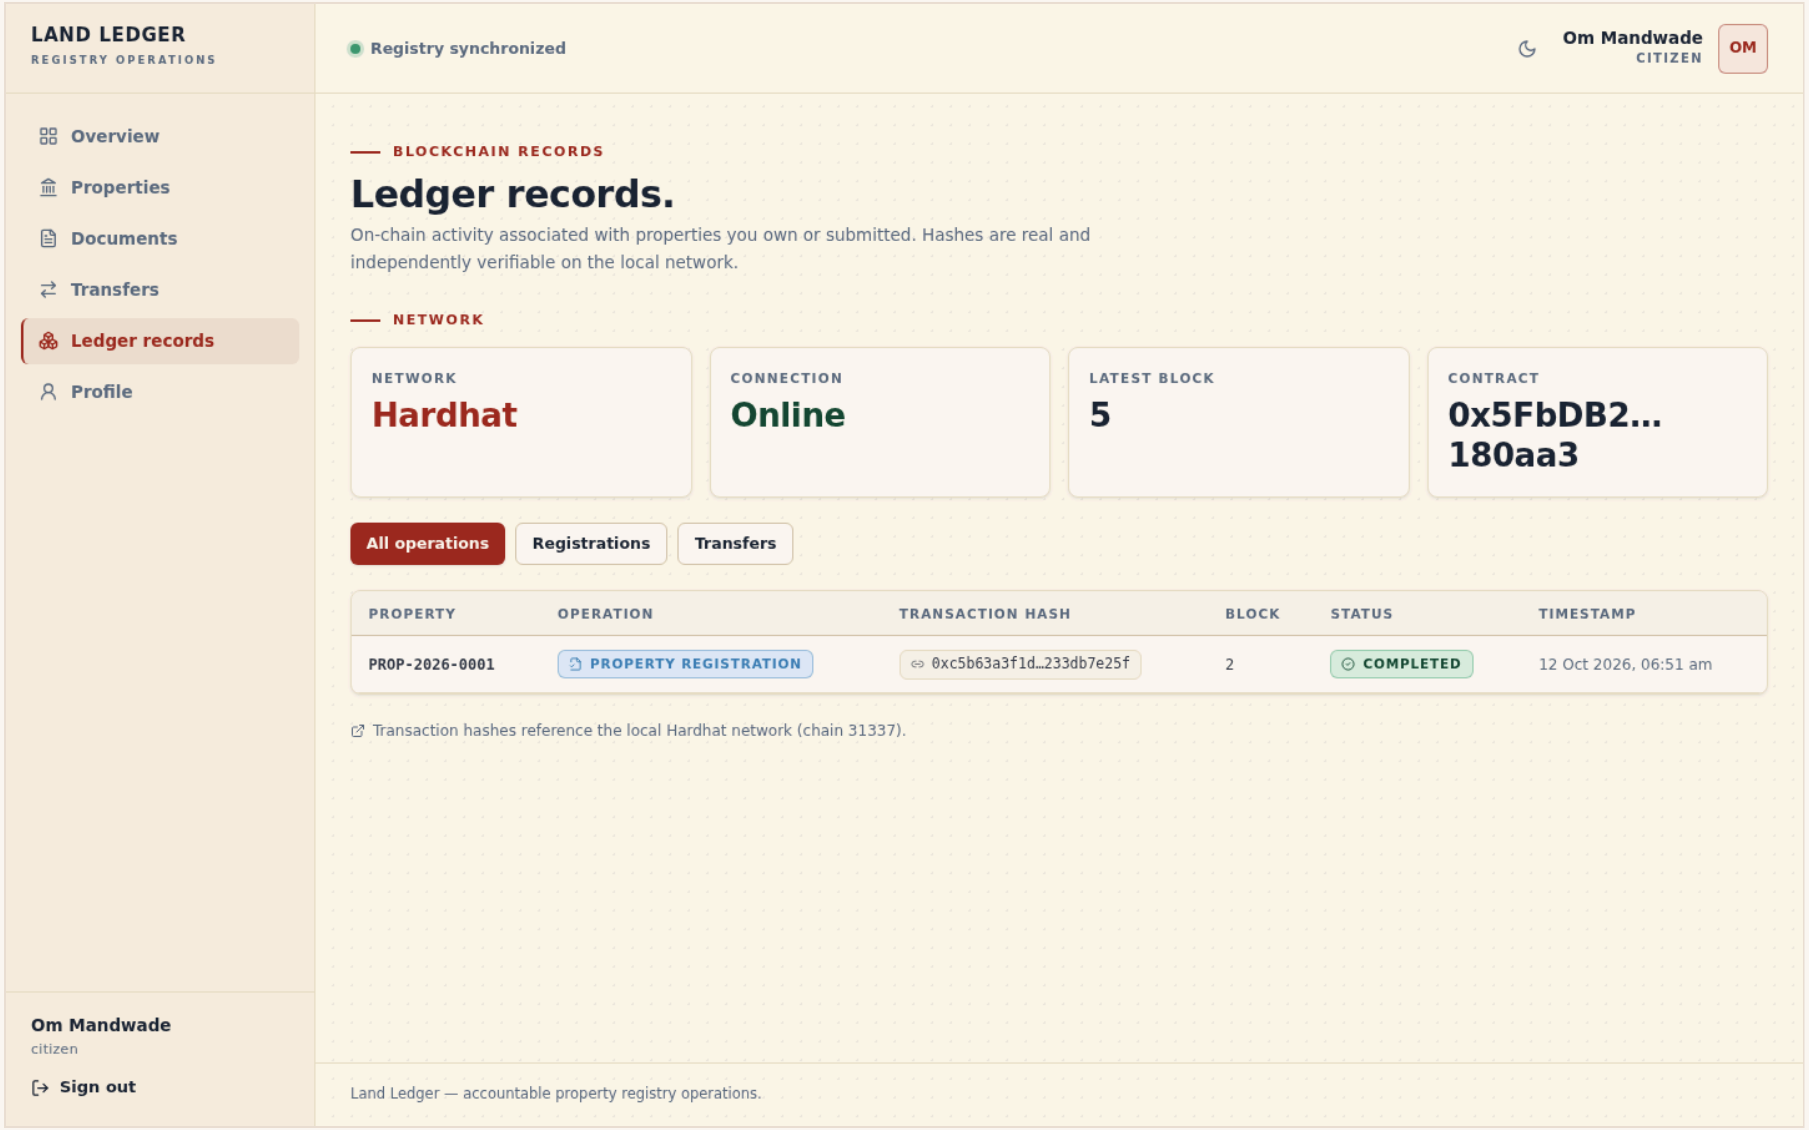

The transfer's stage timeline records each step with actor and timestamp - a paper trail the blockchain will ultimately stamp.

New transfer form

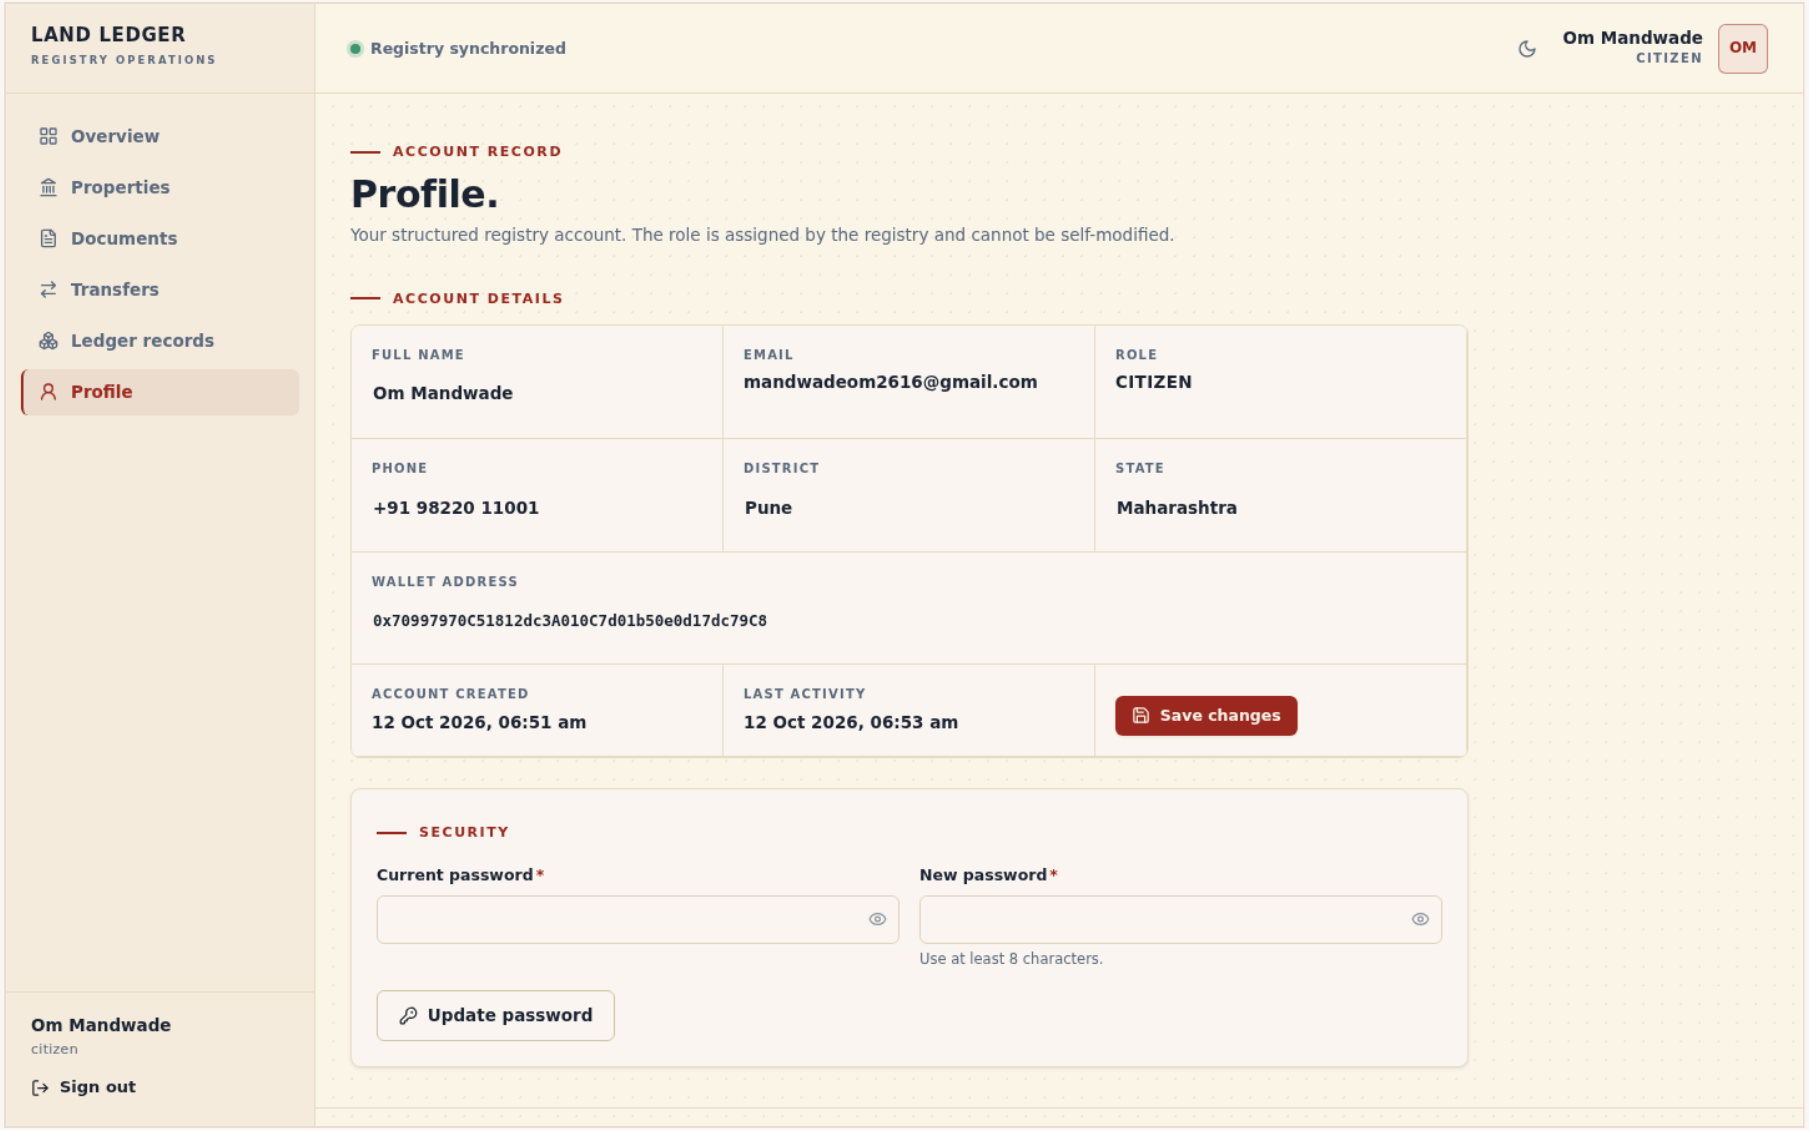

Initiating a transfer: pick the property, name the buyer, agree the amount. The workflow builds its own consent checklist from the ownership data.

Citizen ledger view

The blockchain ledger as citizens see it: read-only blocks with hashes and timestamps proving no record was altered after the fact.

The profile page closes the citizen tour: identity, contact and role - the account that anchors all of this activity.

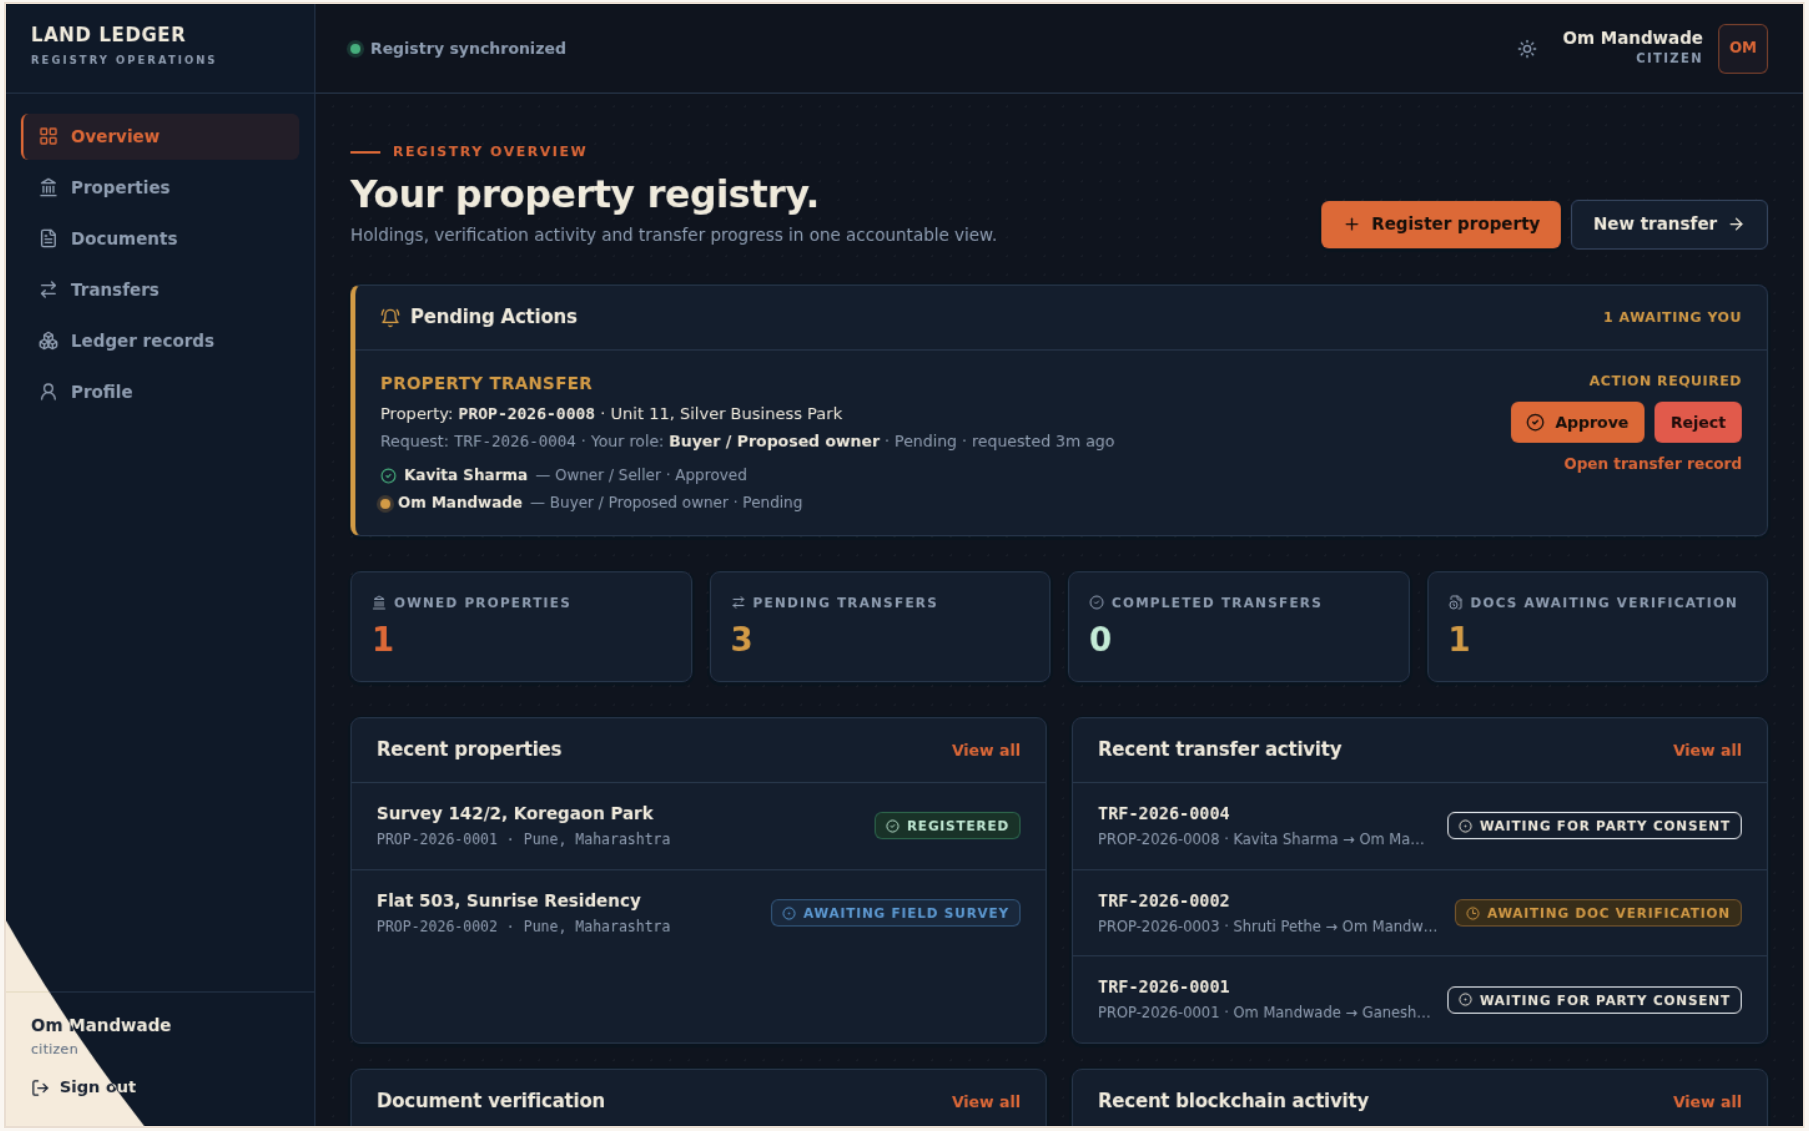

ACT 05 · SCREENS 23-25

The theme morph

05

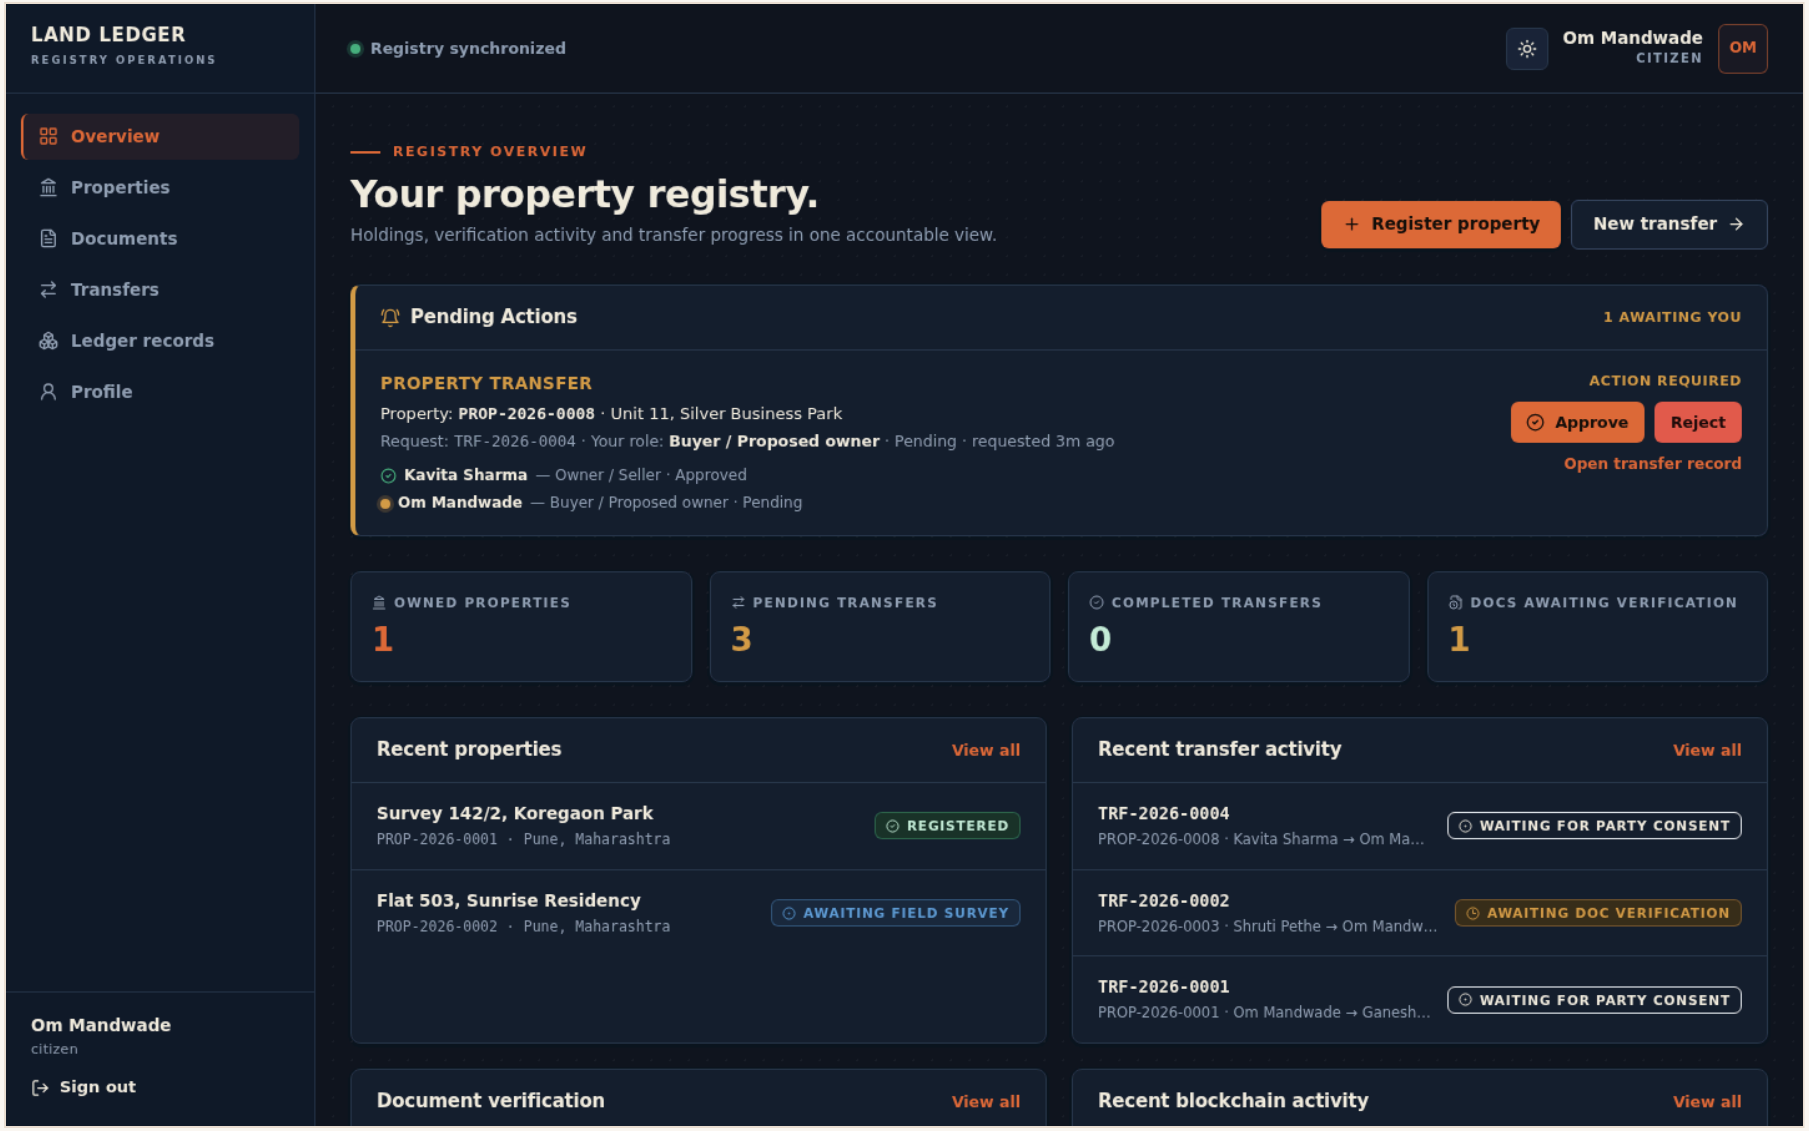

One design flourish worth showing on purpose: the theme toggle fires a circular reveal that expands from the exact pixel you clicked, driven by the browser's View Transitions API with a WAAPI clip-path animation. It is pure polish - and evaluators remember it.

The circular morph

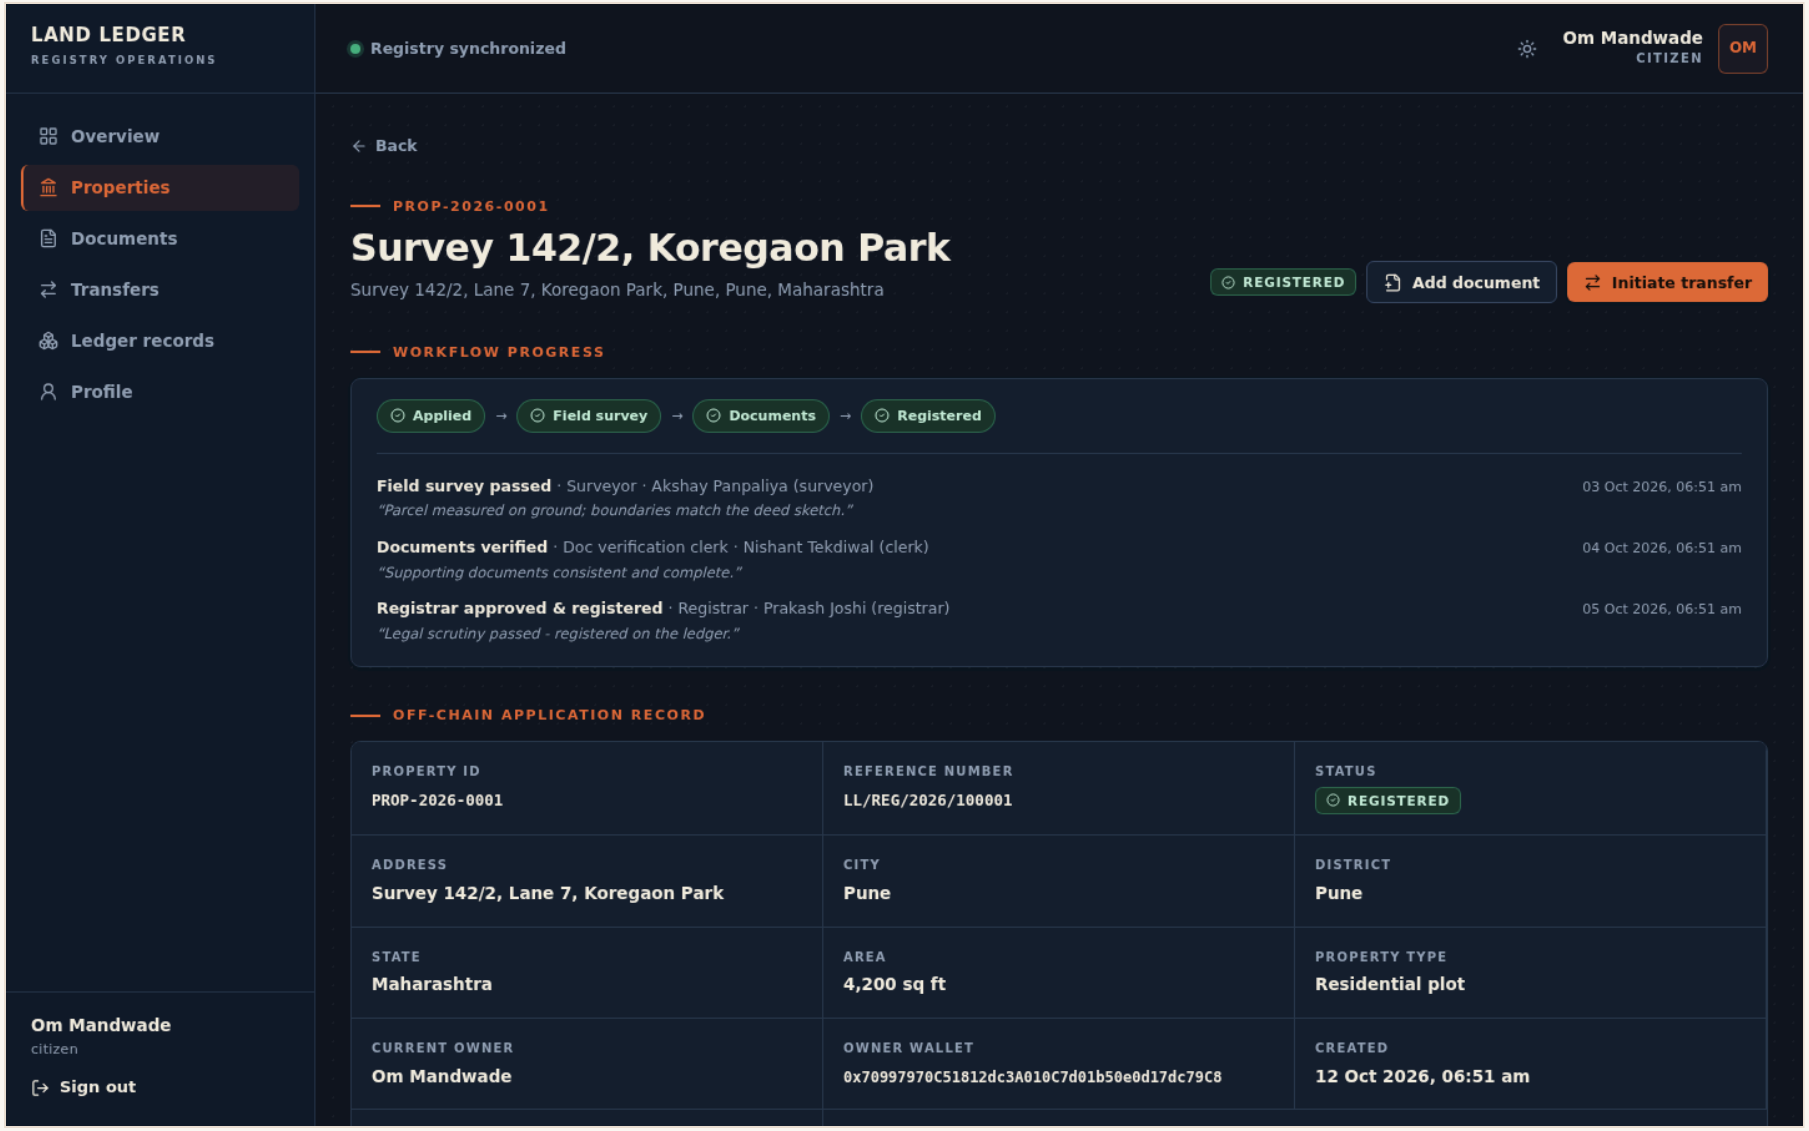

A frame captured mid-morph: the new dark theme blooms outward from the toggle as a growing circle. Origin is the click point itself - keyboard triggers anchor to the button.

Dashboard in dark

Twelve hundred milliseconds later the whole dashboard is dark: every surface re-themed, no layout shifted, and the preference persists for the next visit.

Property detail in dark

The same property file in dark - panels, badges and the on-chain record all legible, proving the re-theme is complete rather than cosmetic.

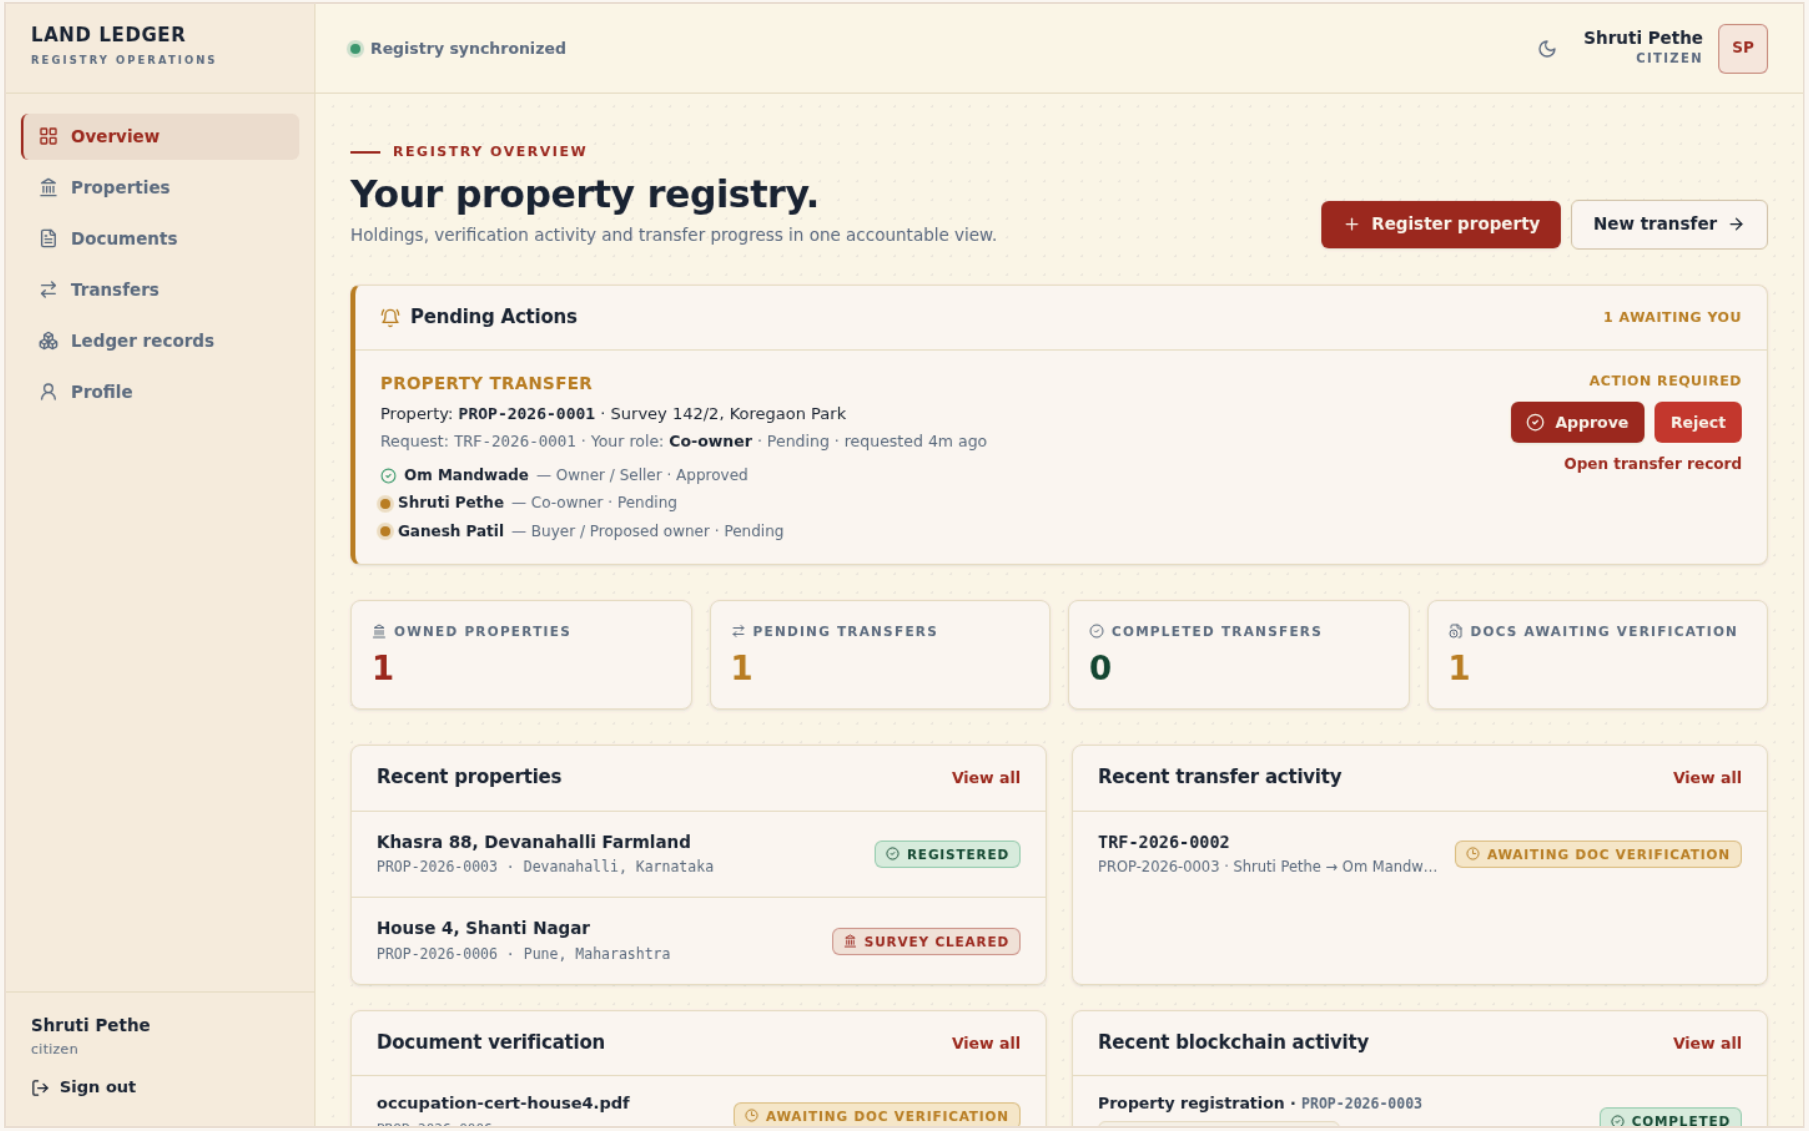

ACT 06 · SCREENS 26-33

Multi-party consent

06

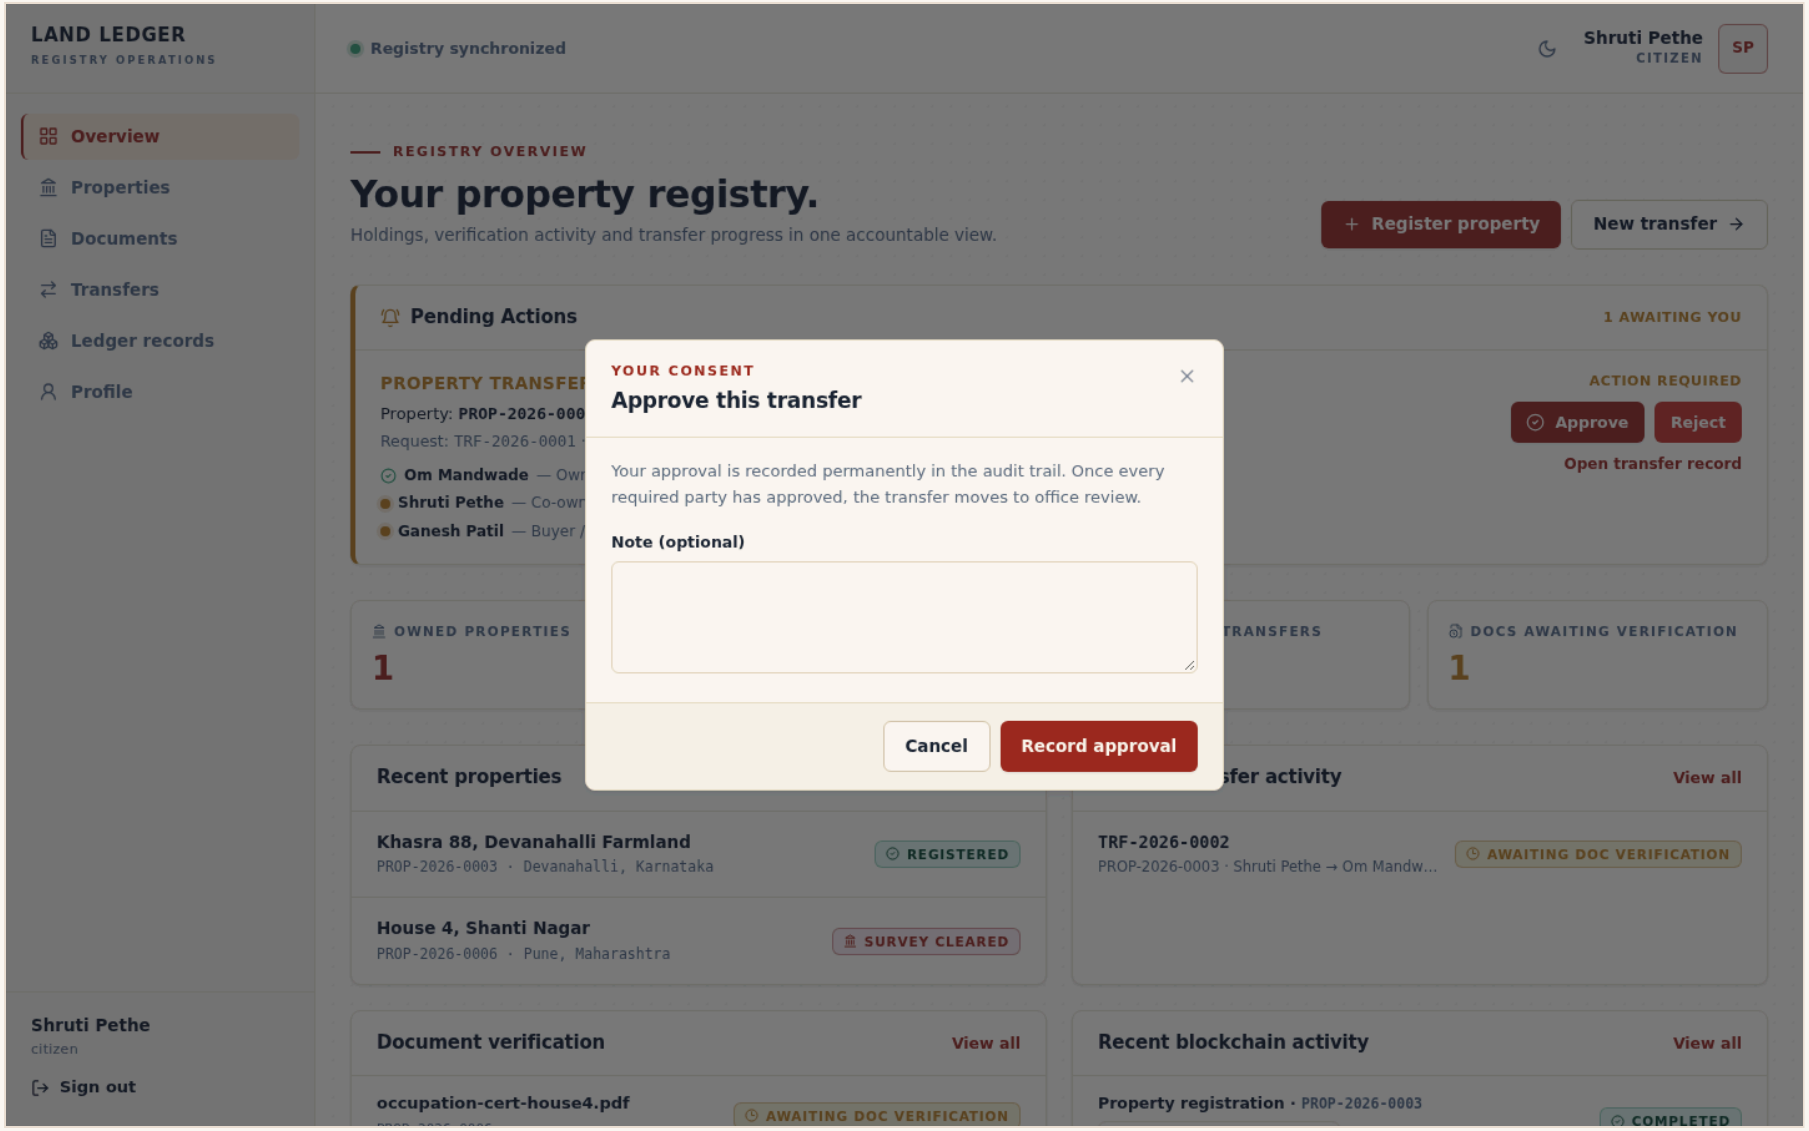

A land transfer is never one person's decision. Om's co-owner Shruti and the buyer Ganesh must both consent, each with a recorded note attached to their approval. Watch the transfer's status flip the moment the last signature lands - no office involvement, pure protocol.

Shruti's pending consent

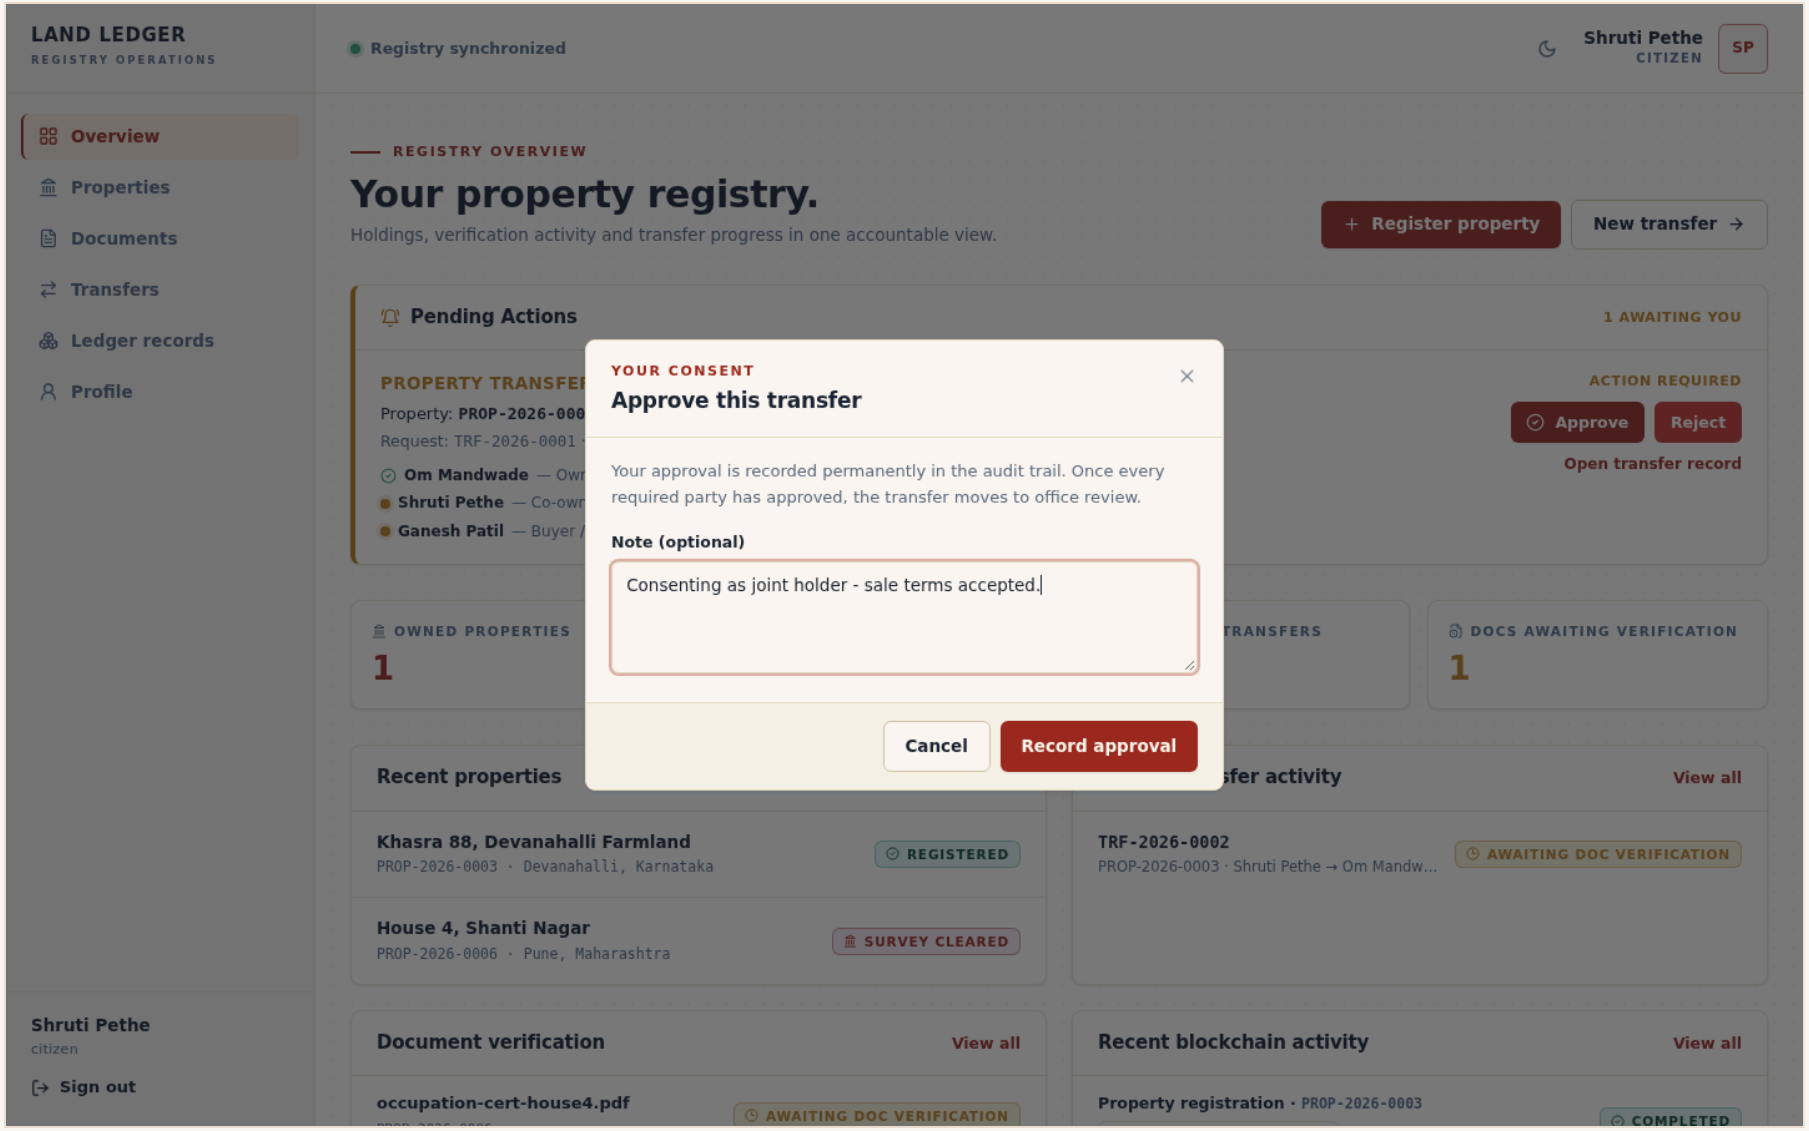

Cut to co-owner Shruti Pethe: her dashboard flags one pending action. Her consent is required before Om's transfer can move an inch.

Consent dialog

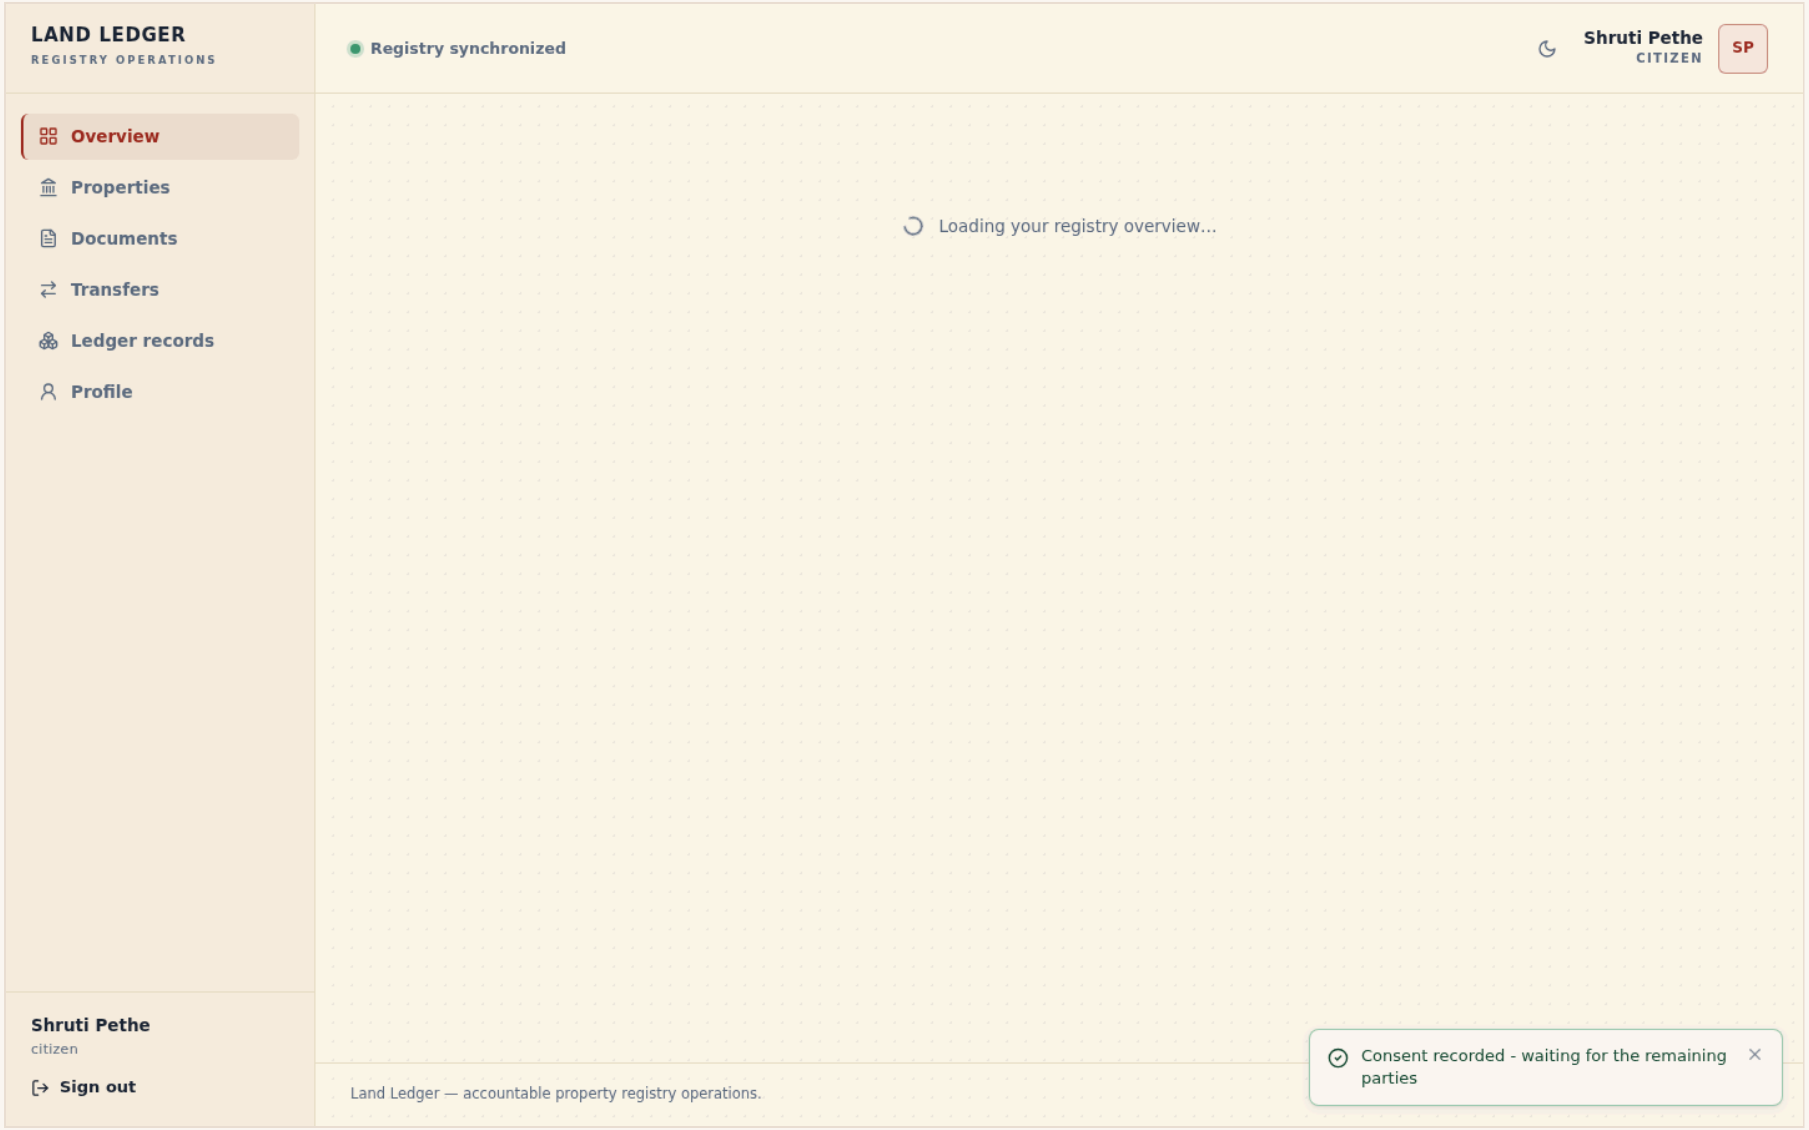

Opening the request brings up the approve dialog with the full transfer context - parties, property, amount. She signs off knowingly, not blindly.

Consent note

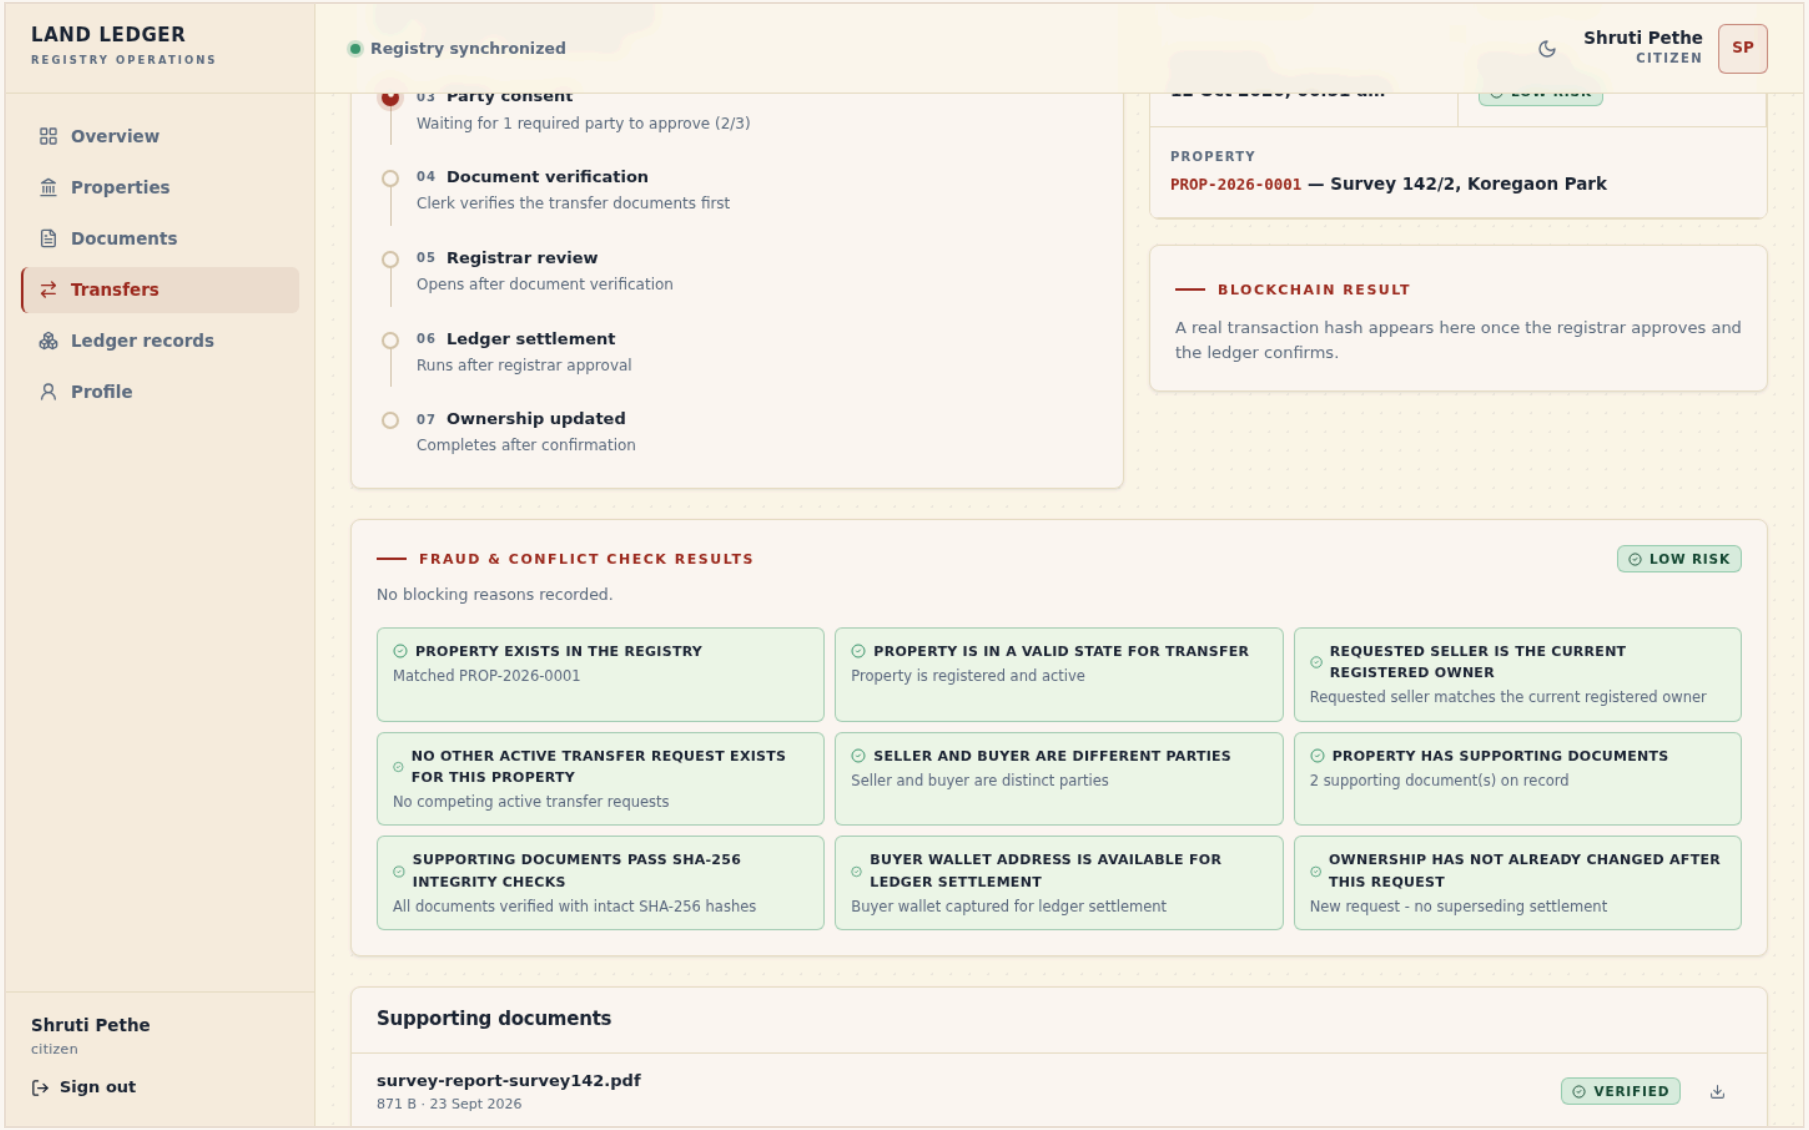

She adds a consent note as she approves. Every approval is attributable and worded - accountability is built into the click.

Approval recorded

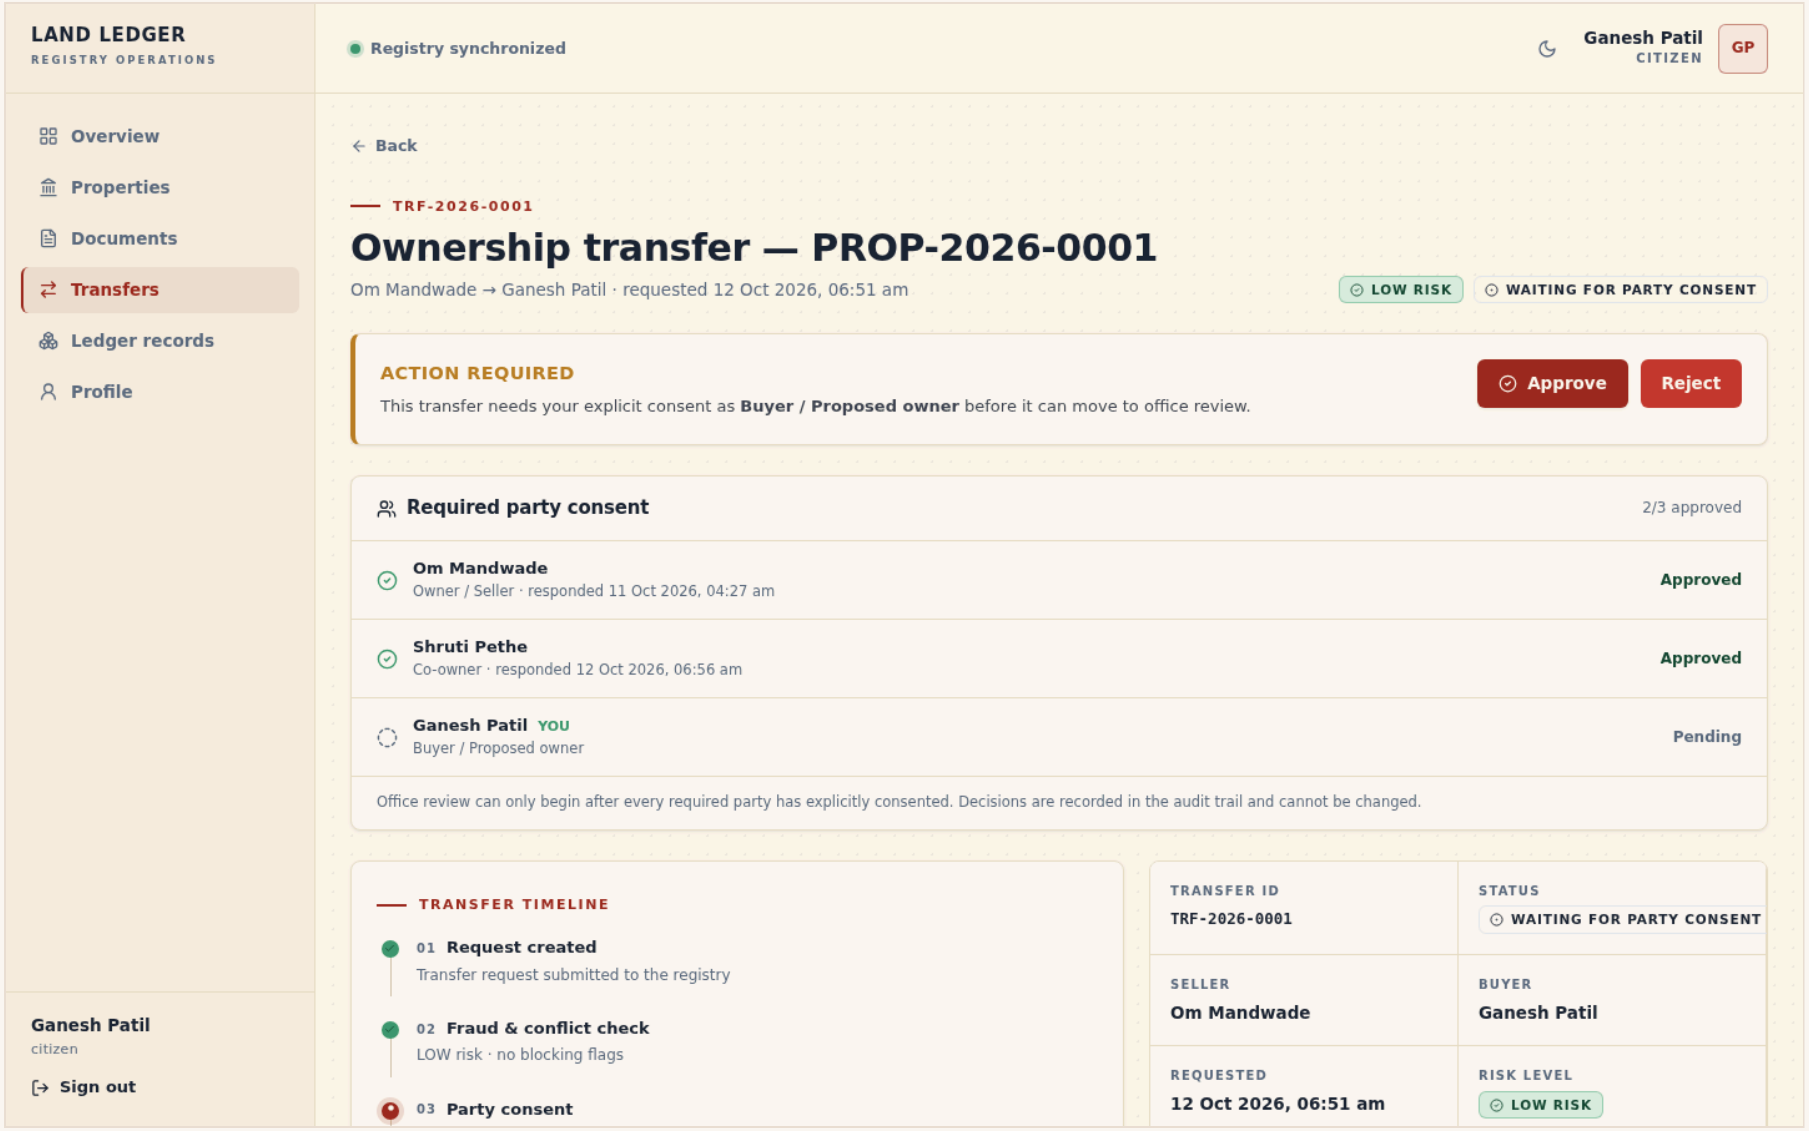

The toast confirms her consent is on file. One signature down.

Consent table updated

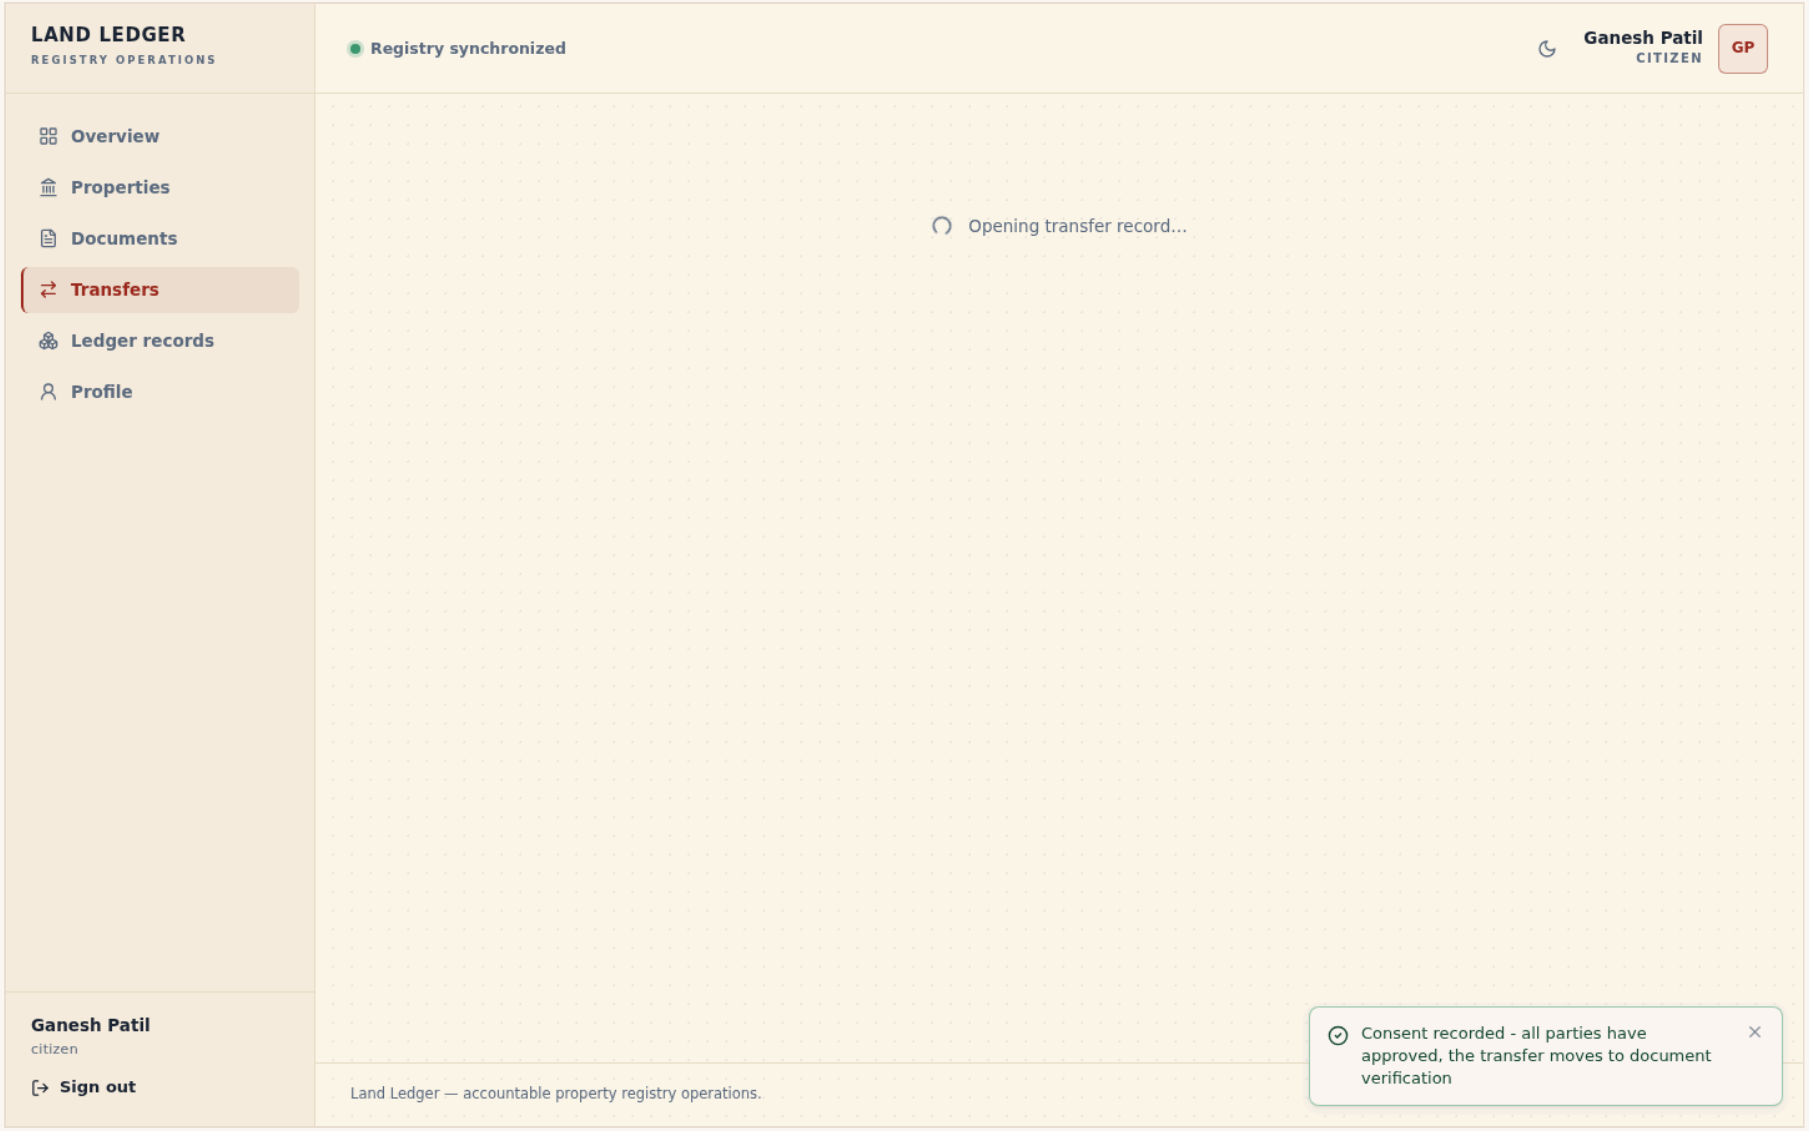

The parties table now shows Shruti APPROVED with her note and timestamp. One approval left before the case can move.

The buyer's view

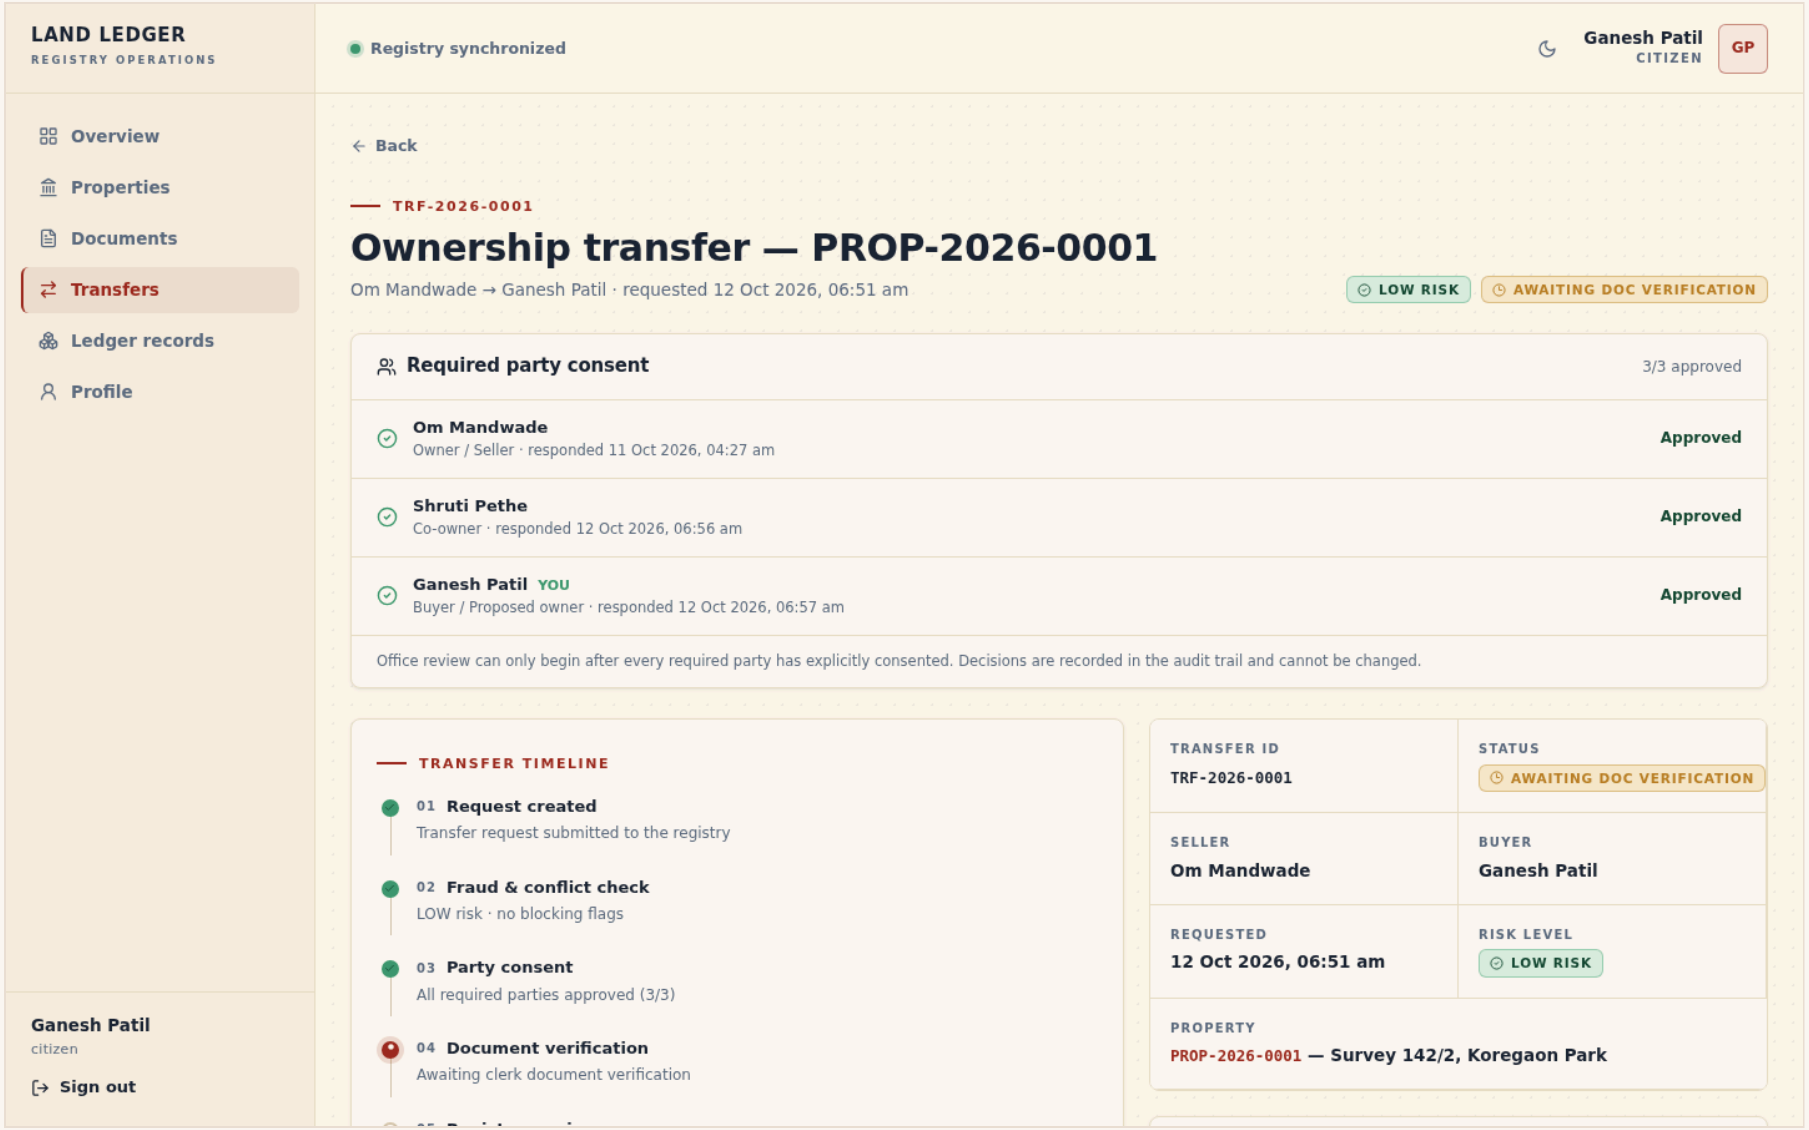

Ganesh Patil, the buyer, signs in and sees the same transfer from his side. He is the one buying - his consent is the final gate.

Buyer approves

Ganesh approves. Both required parties have consented, each with their own note on the record.

Status advances

The transfer advances on its own now that every required party has consented - the case leaves the consent stage and starts moving through the offices.

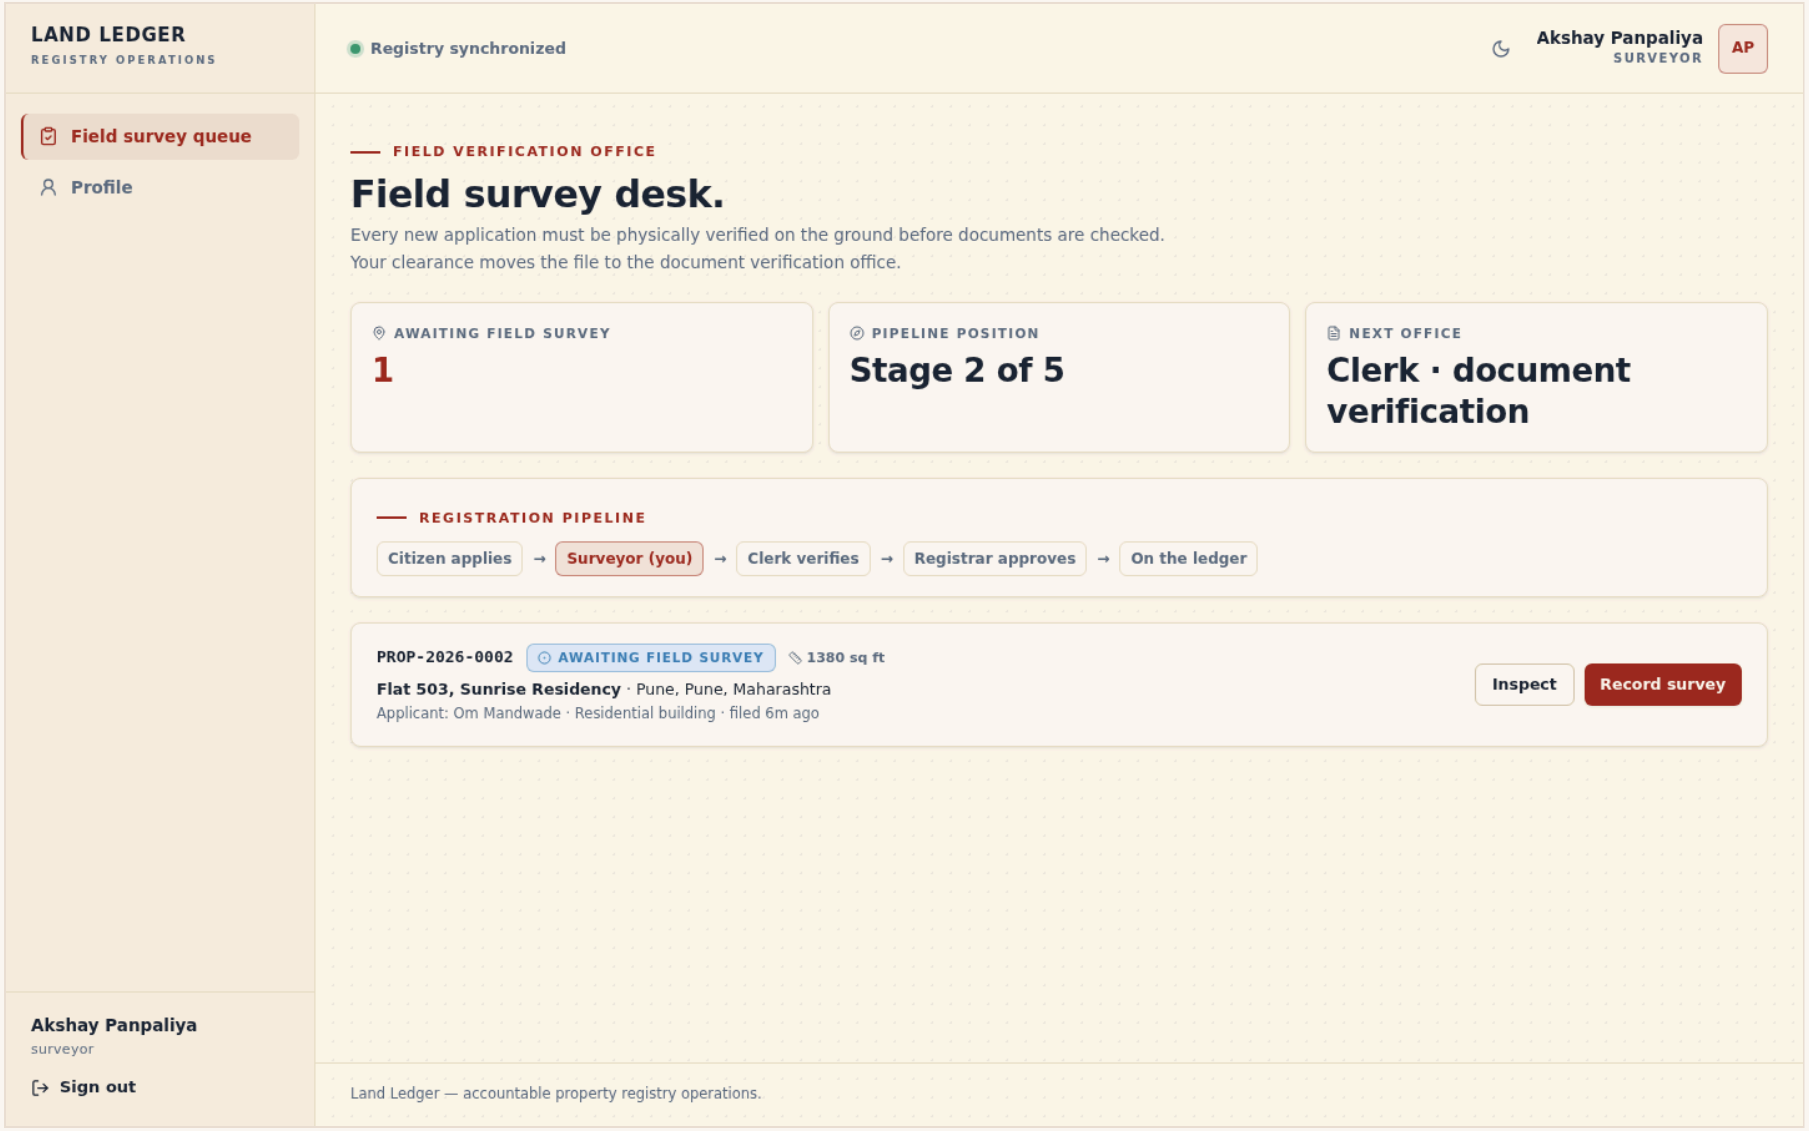

ACT 07 · SCREENS 34-39

Surveyor on the ground

07

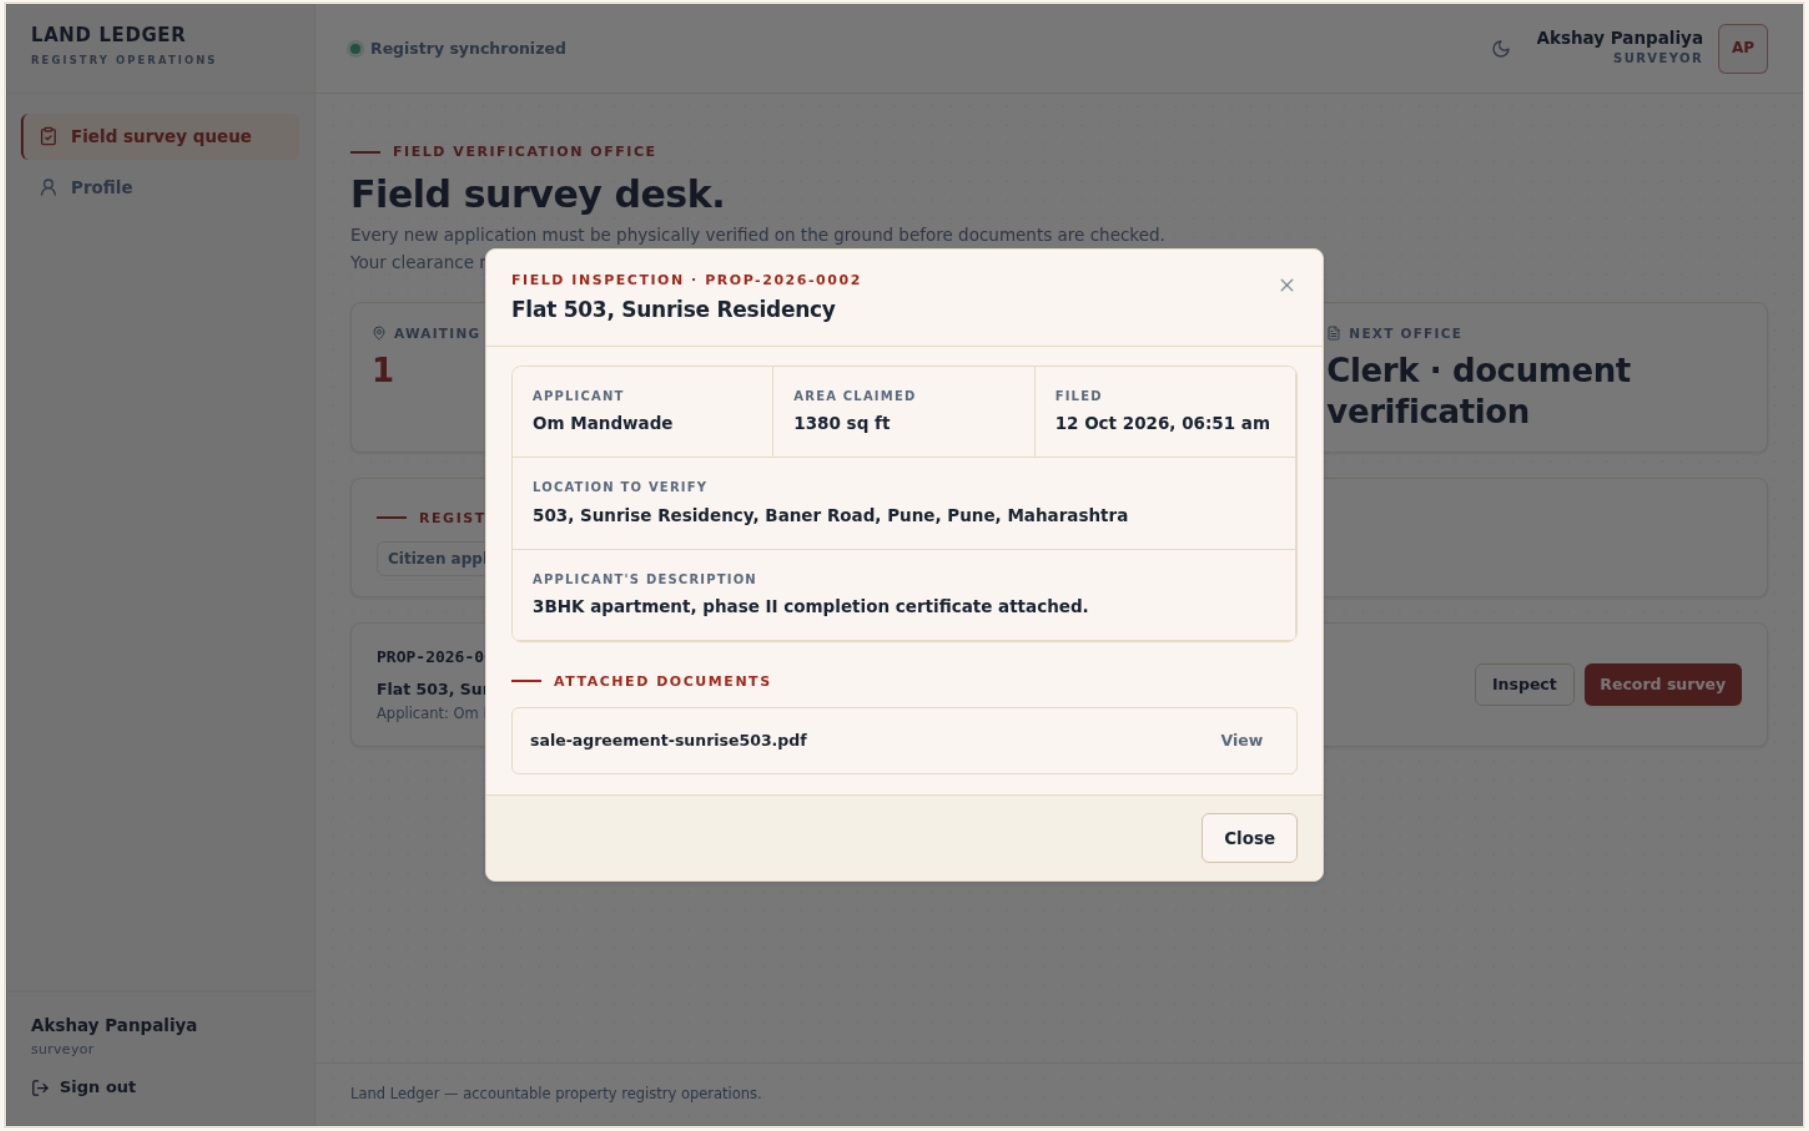

Before any document is trusted, someone walks the land. Surveyor Akshay Panpaliya records boundary status and encroachment findings from the ground visit, and his structured notes become a permanent part of the case file that every later office reads.

Field survey queue

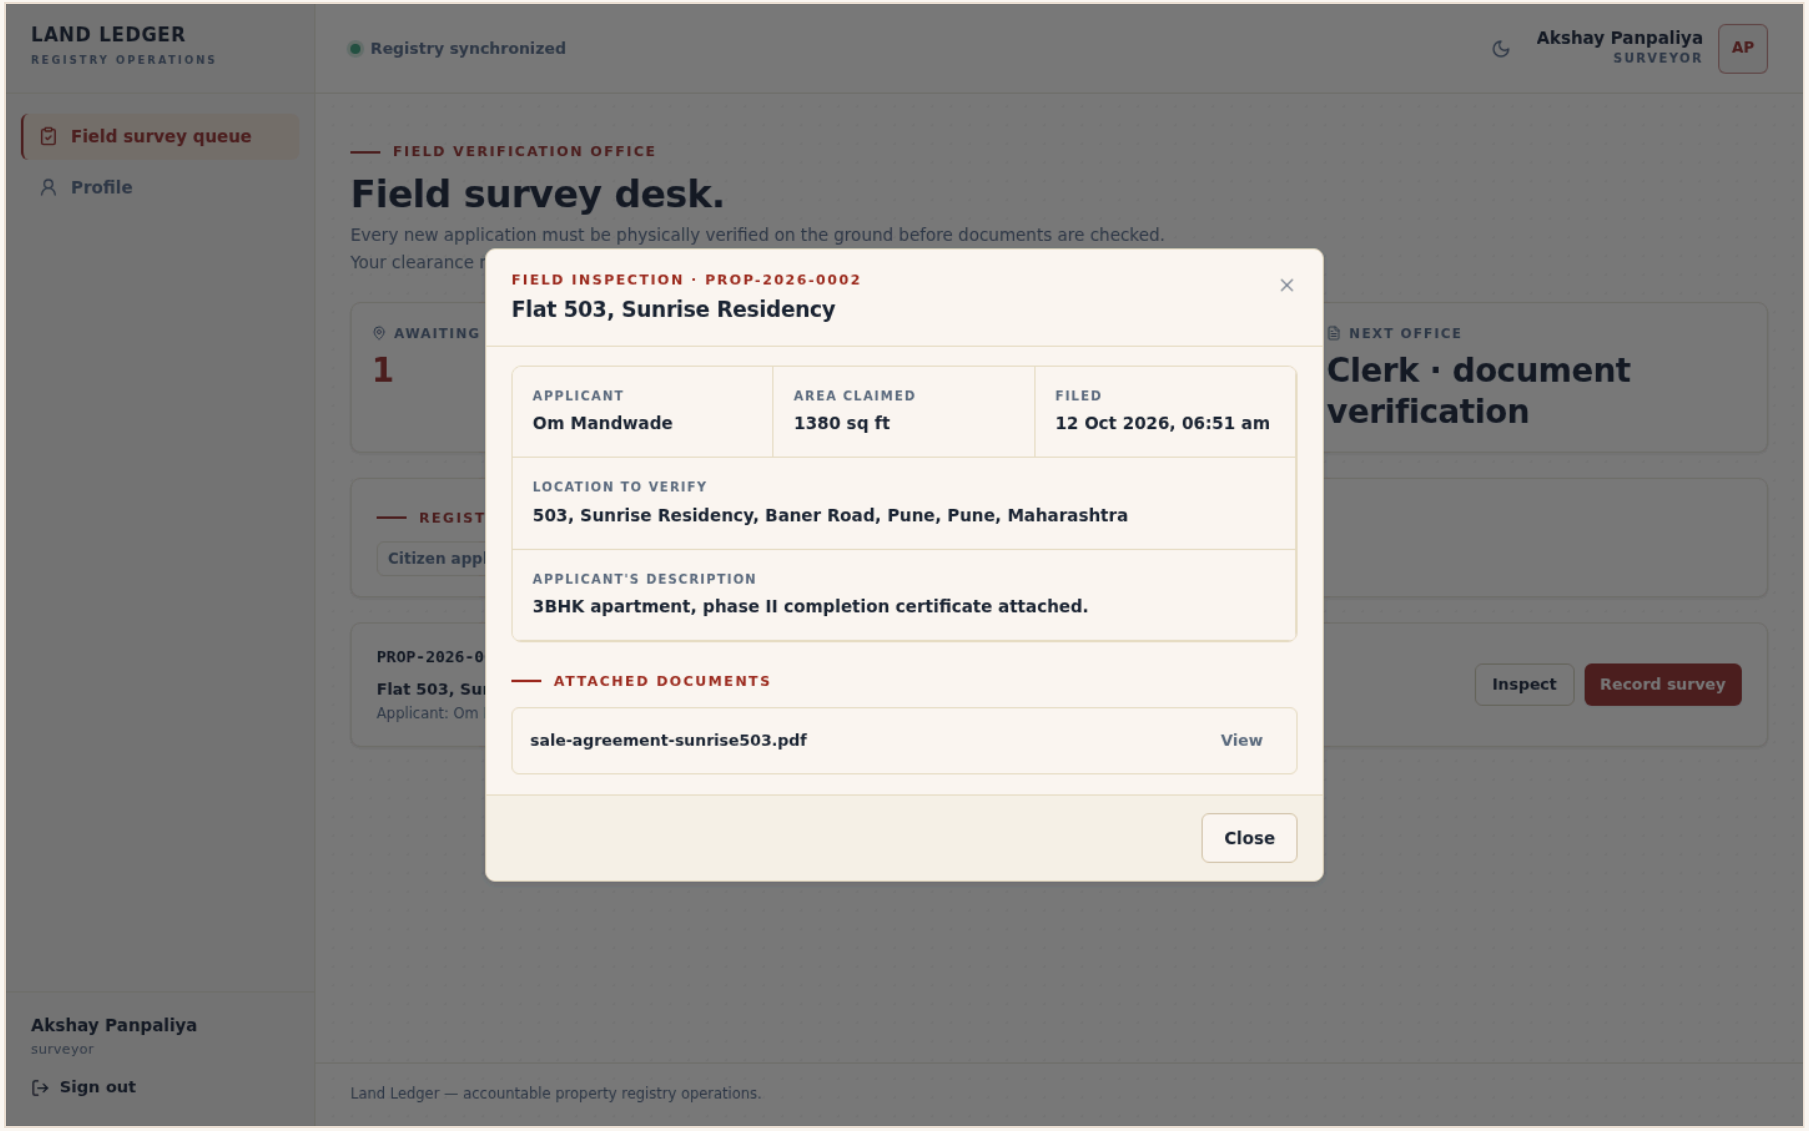

The surveyor's field queue: properties cleared for ground inspection, each with location and applicant details for planning the visit.

Survey case file

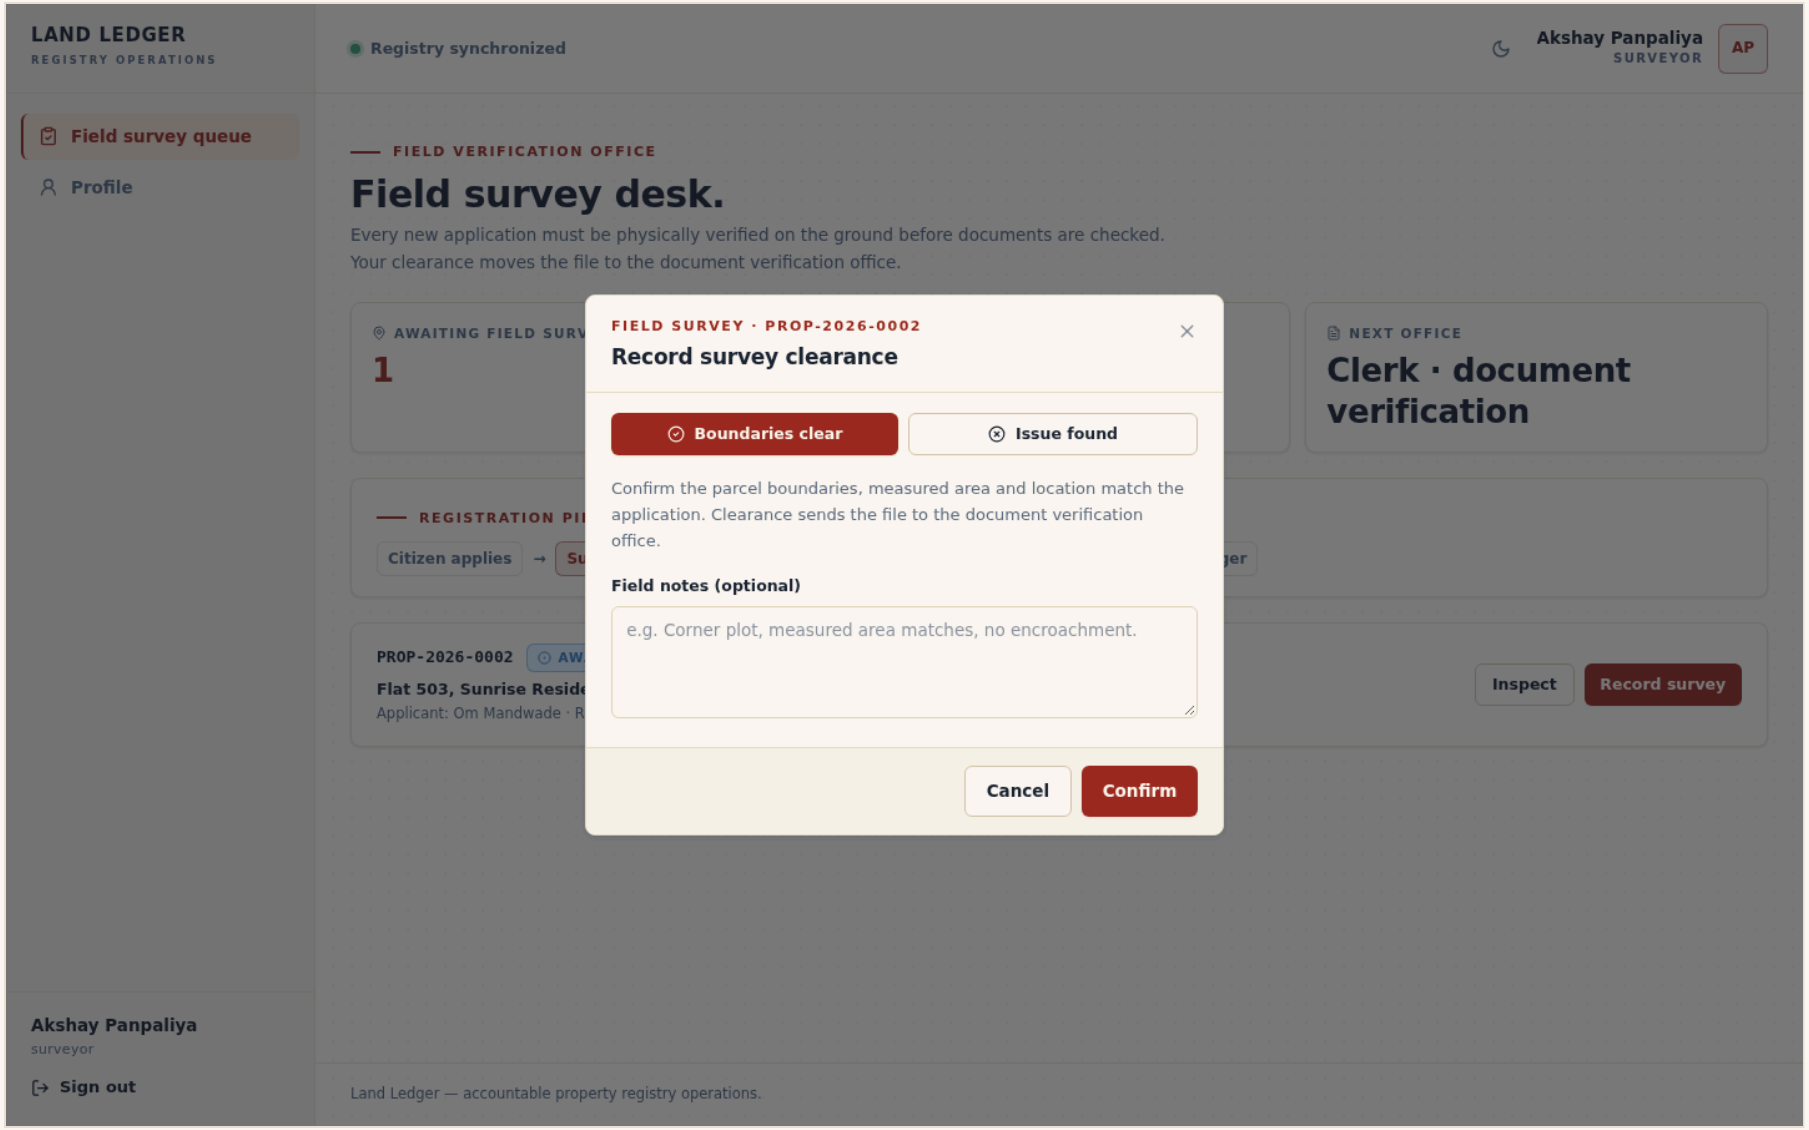

The case file for inspection: boundaries, area, sketch and the applicant's submitted data, ready for field comparison.

Field inspection dialog

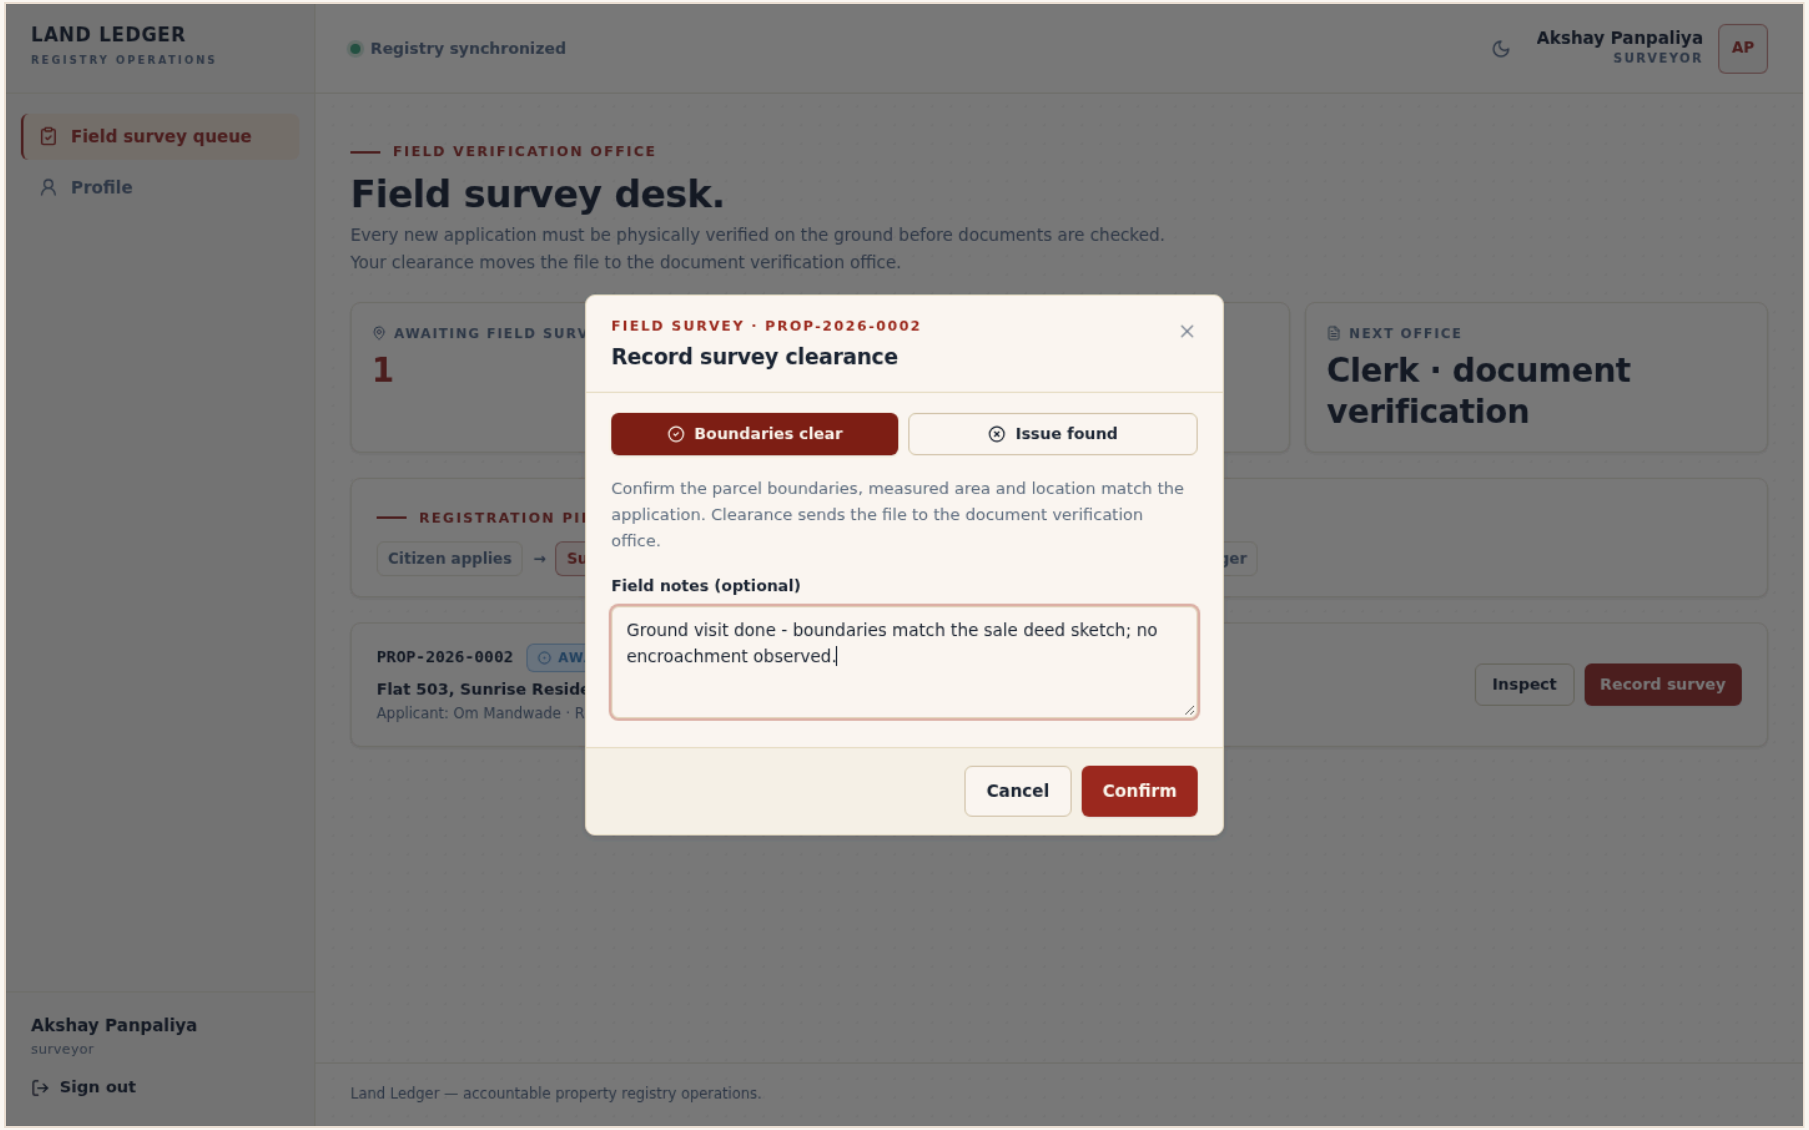

The field inspection dialog - boundary status, encroachment findings and site evidence go in from the ground visit itself.

Recording the verdict

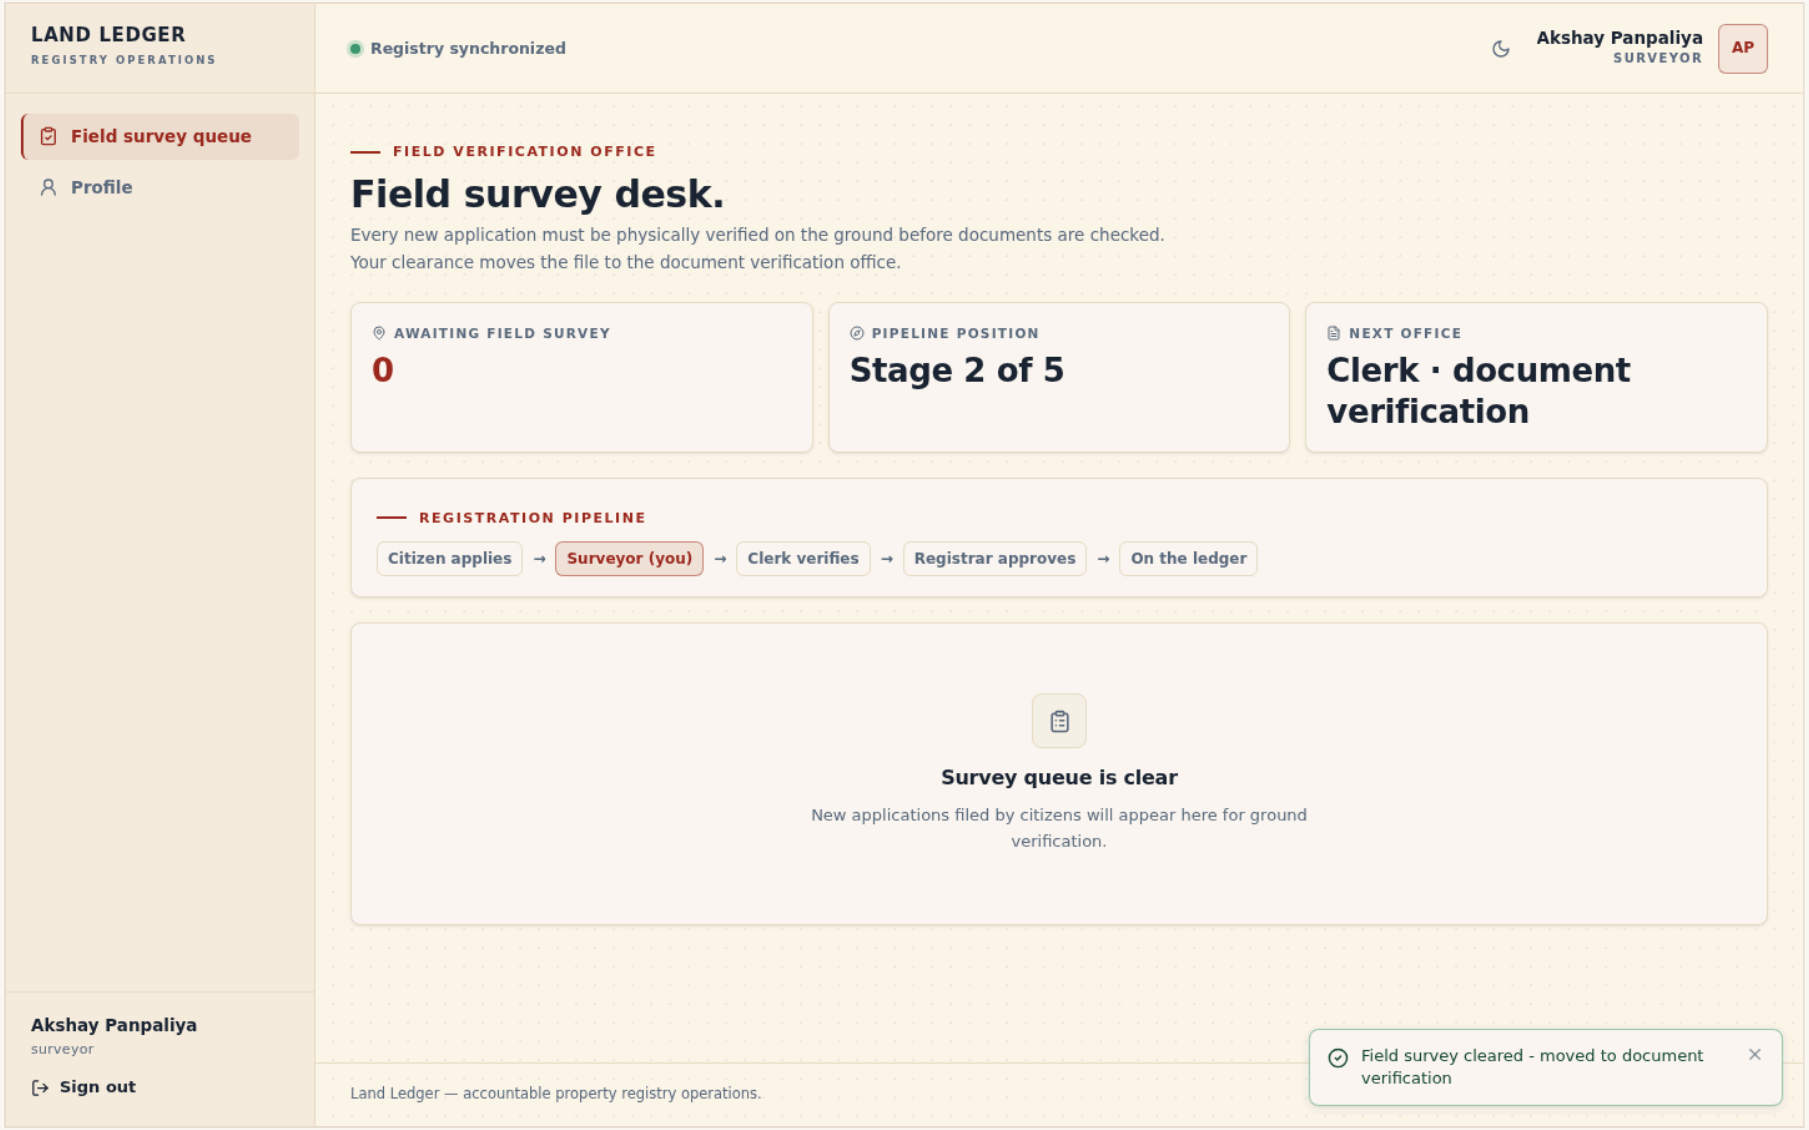

Recording the verdict: boundaries clear or issues found, captured in structured fields so every inspection stays comparable across cases.

Survey notes filled

Notes filled: ground visit done, boundaries match the sale deed sketch, no encroachment observed. The words later offices will rely on.

Survey queue clear

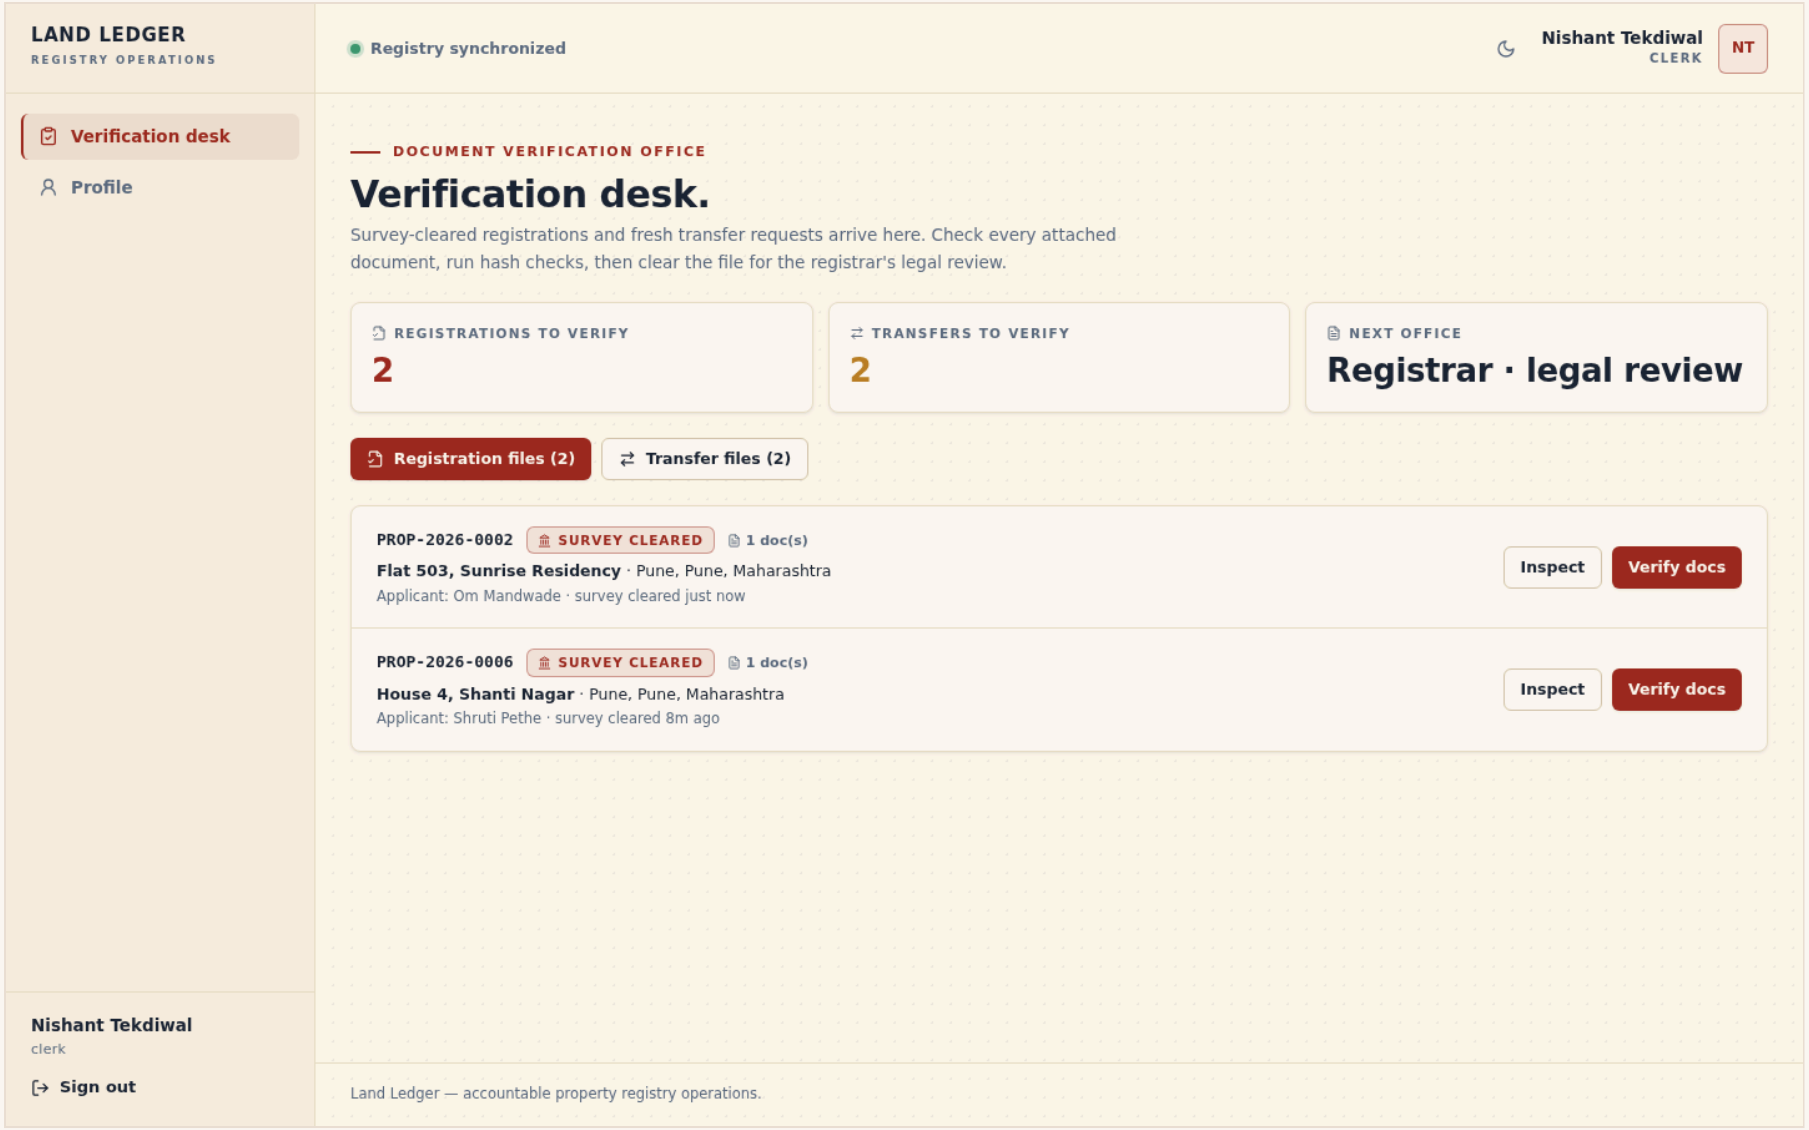

Queue clear - the survey passes and the case moves on to the document verification office with the surveyor's findings attached.

ACT 08 · SCREENS 40-46

The verification desk

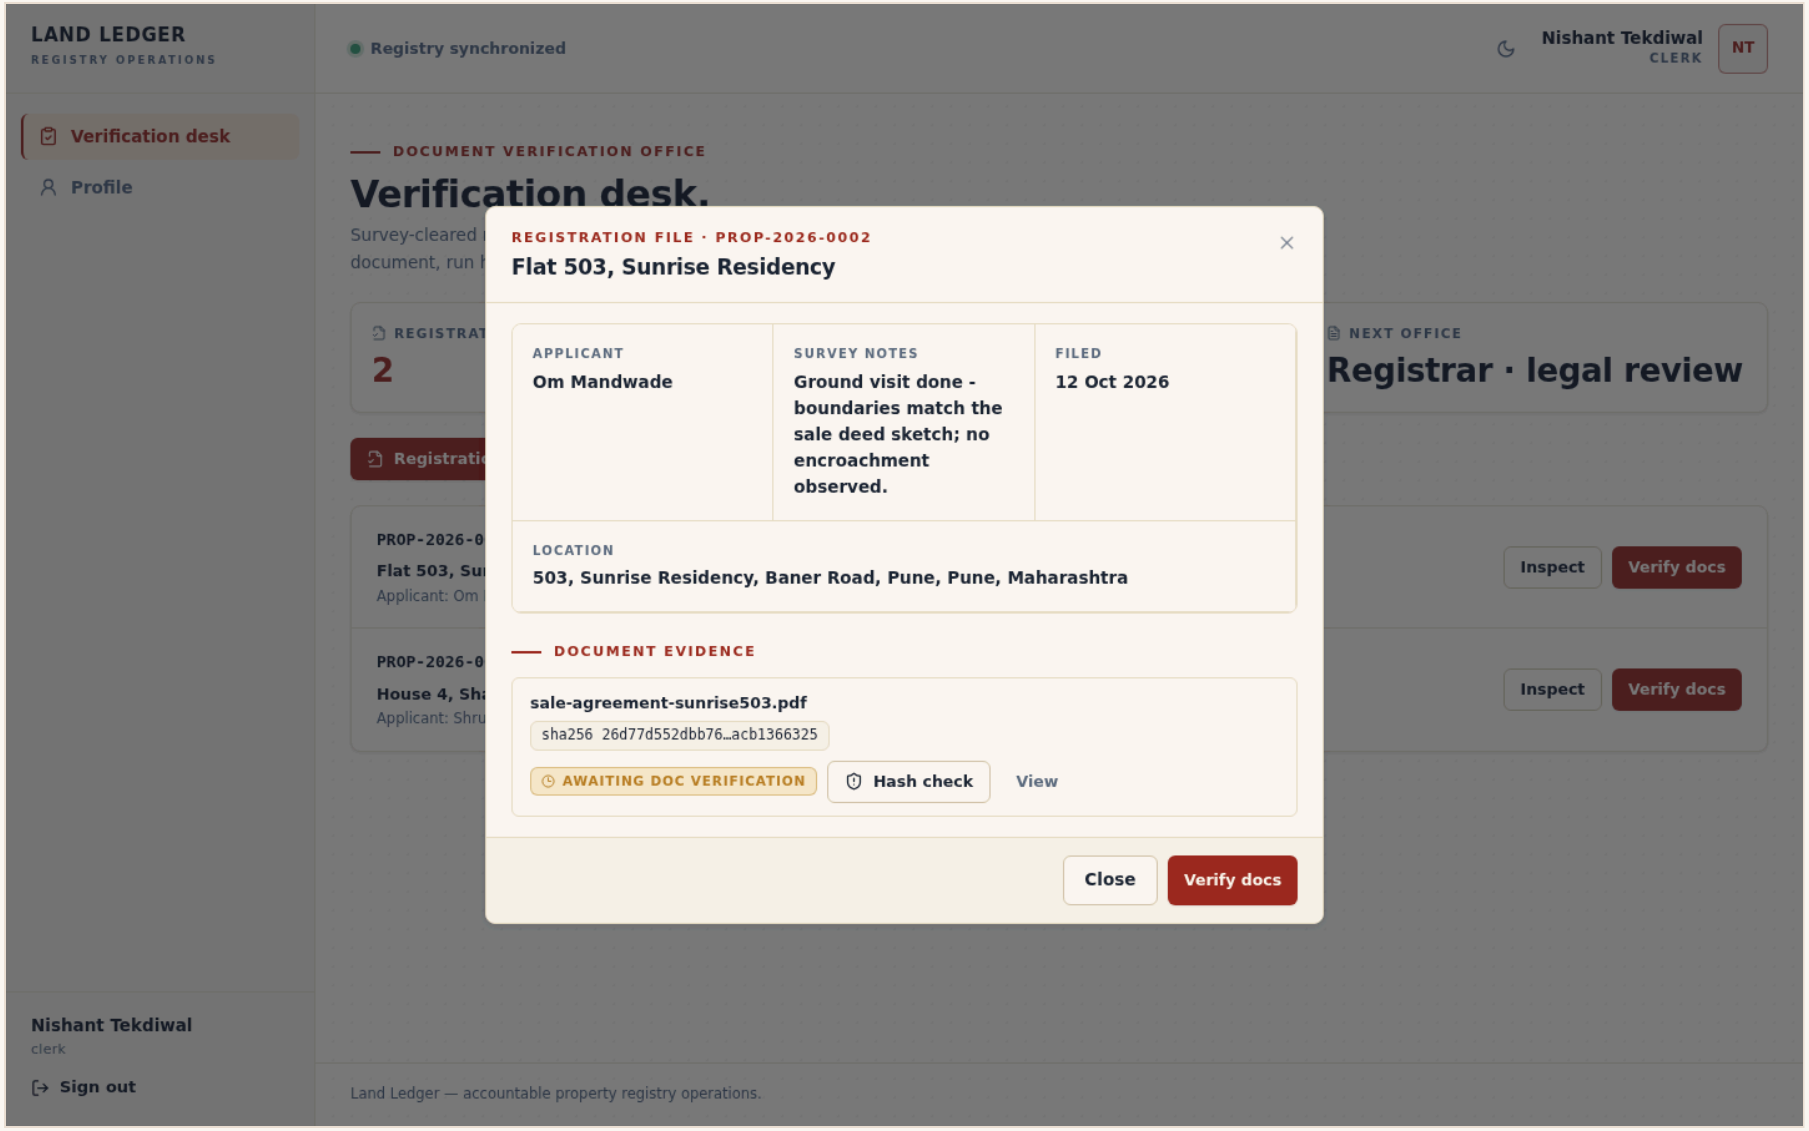

08

The clerk's desk is where fraud dies. Nishant Tekdiwal re-computes every document's SHA-256 fingerprint against the seal applied at upload, and opens the actual PDF to read it. One mismatch and the case stops right here - this act is your strongest integrity talking point.

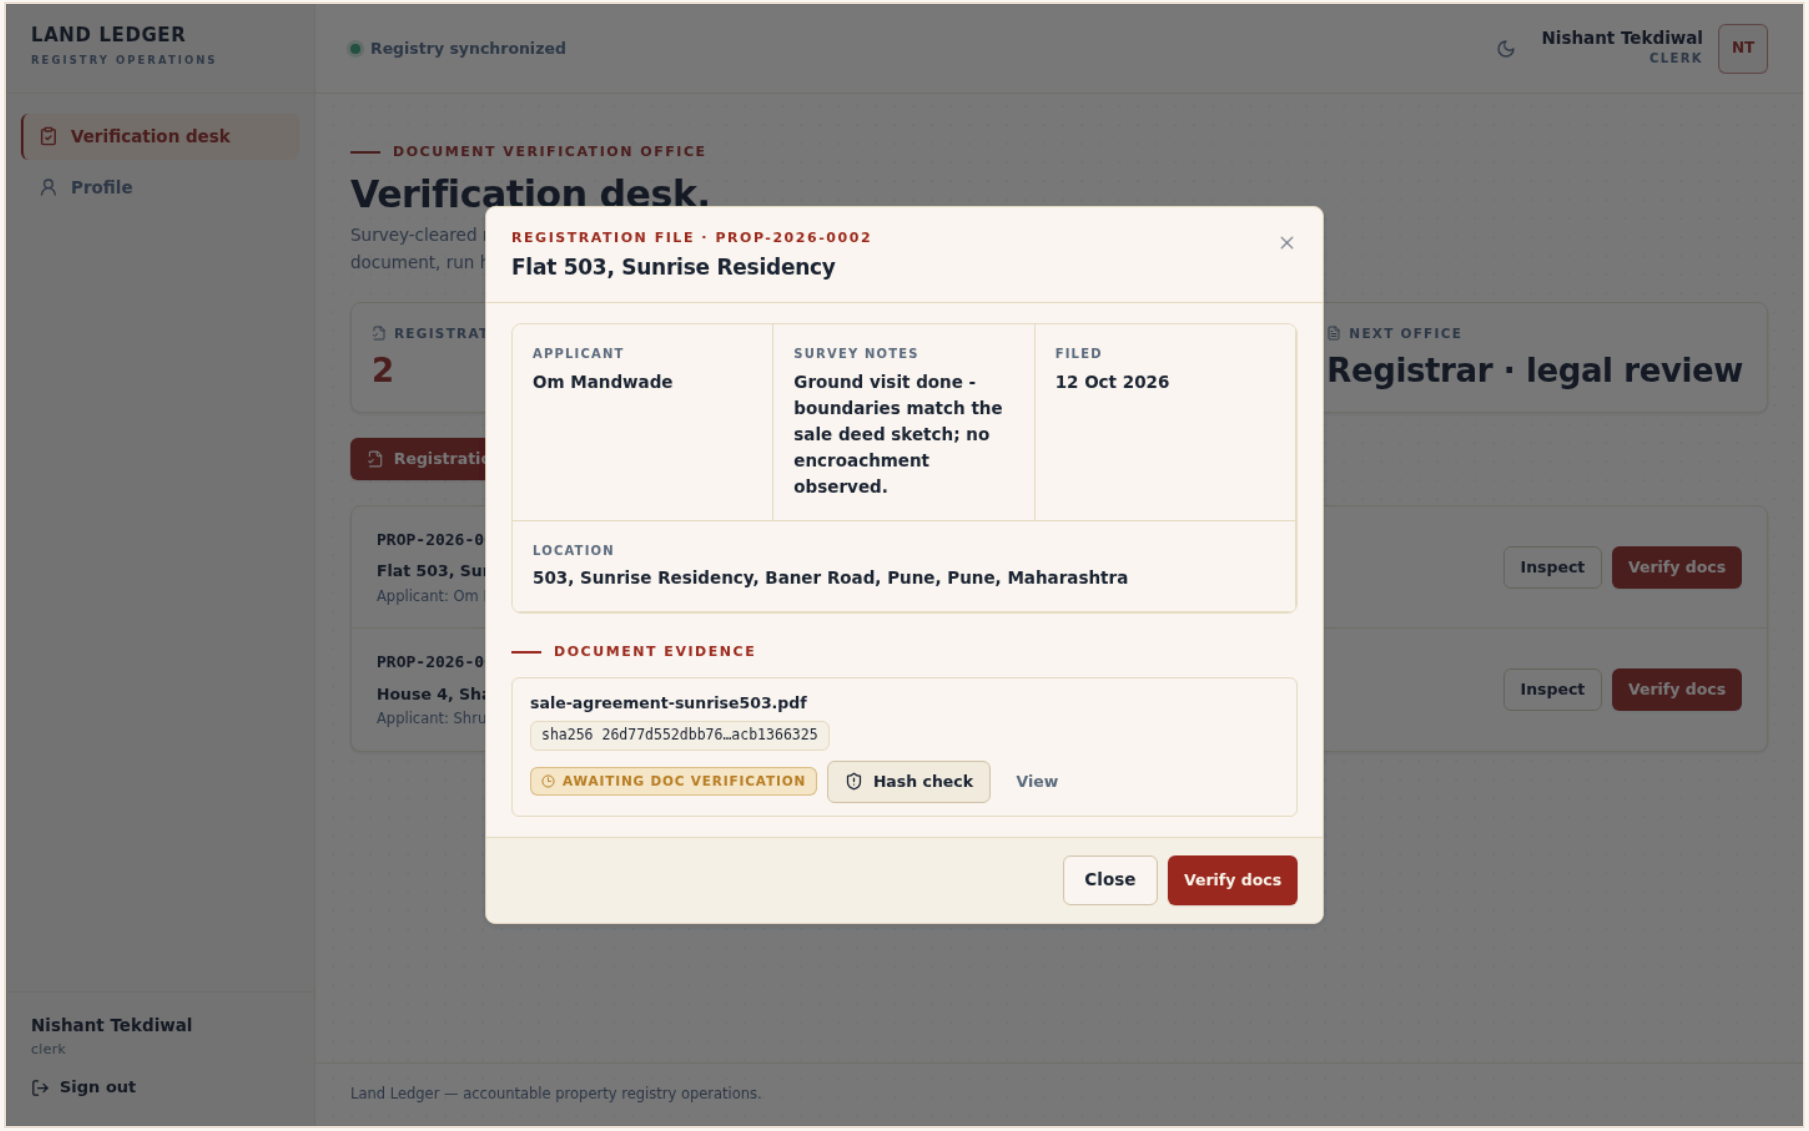

The clerk's desk: survey-cleared files waiting for document checks, each showing its applicant and the next office in line.

File inspection

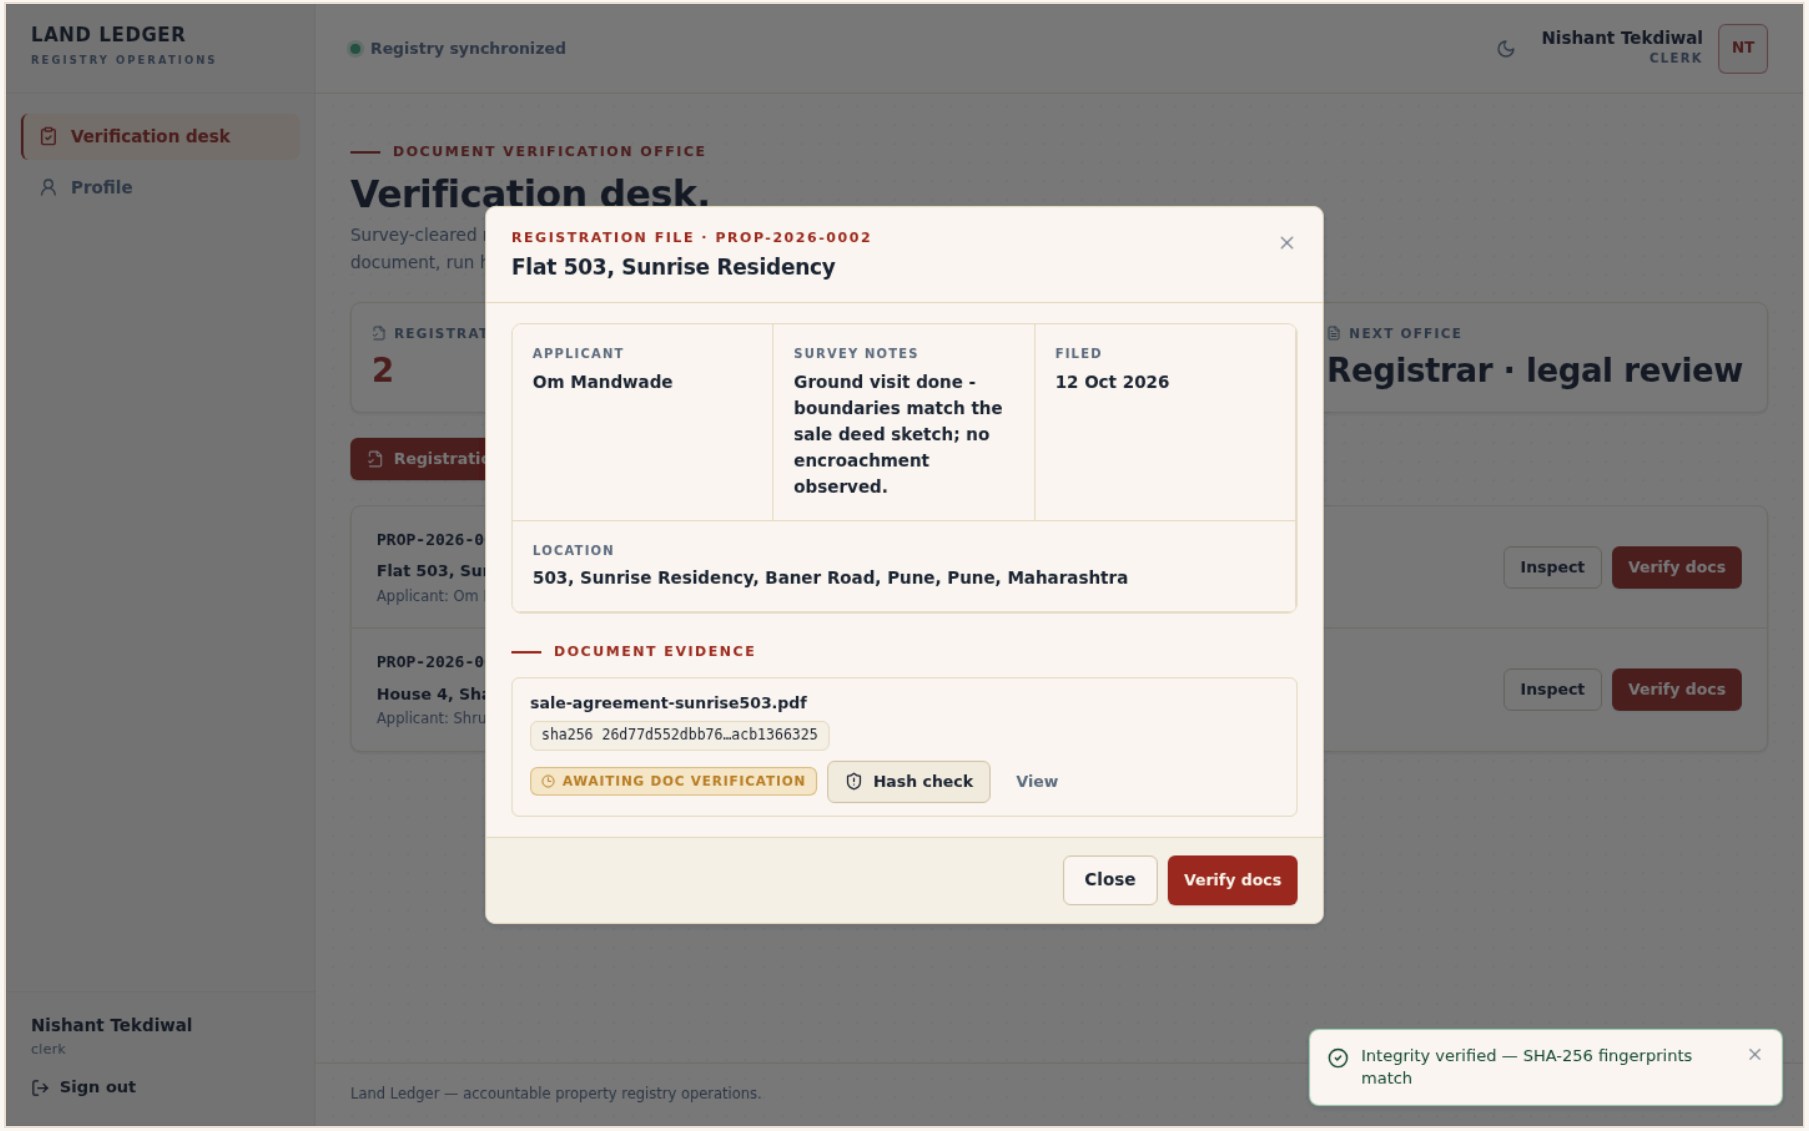

Inspecting the registration file: applicant, survey notes, location and the documentary evidence with its SHA-256 fingerprint on display.

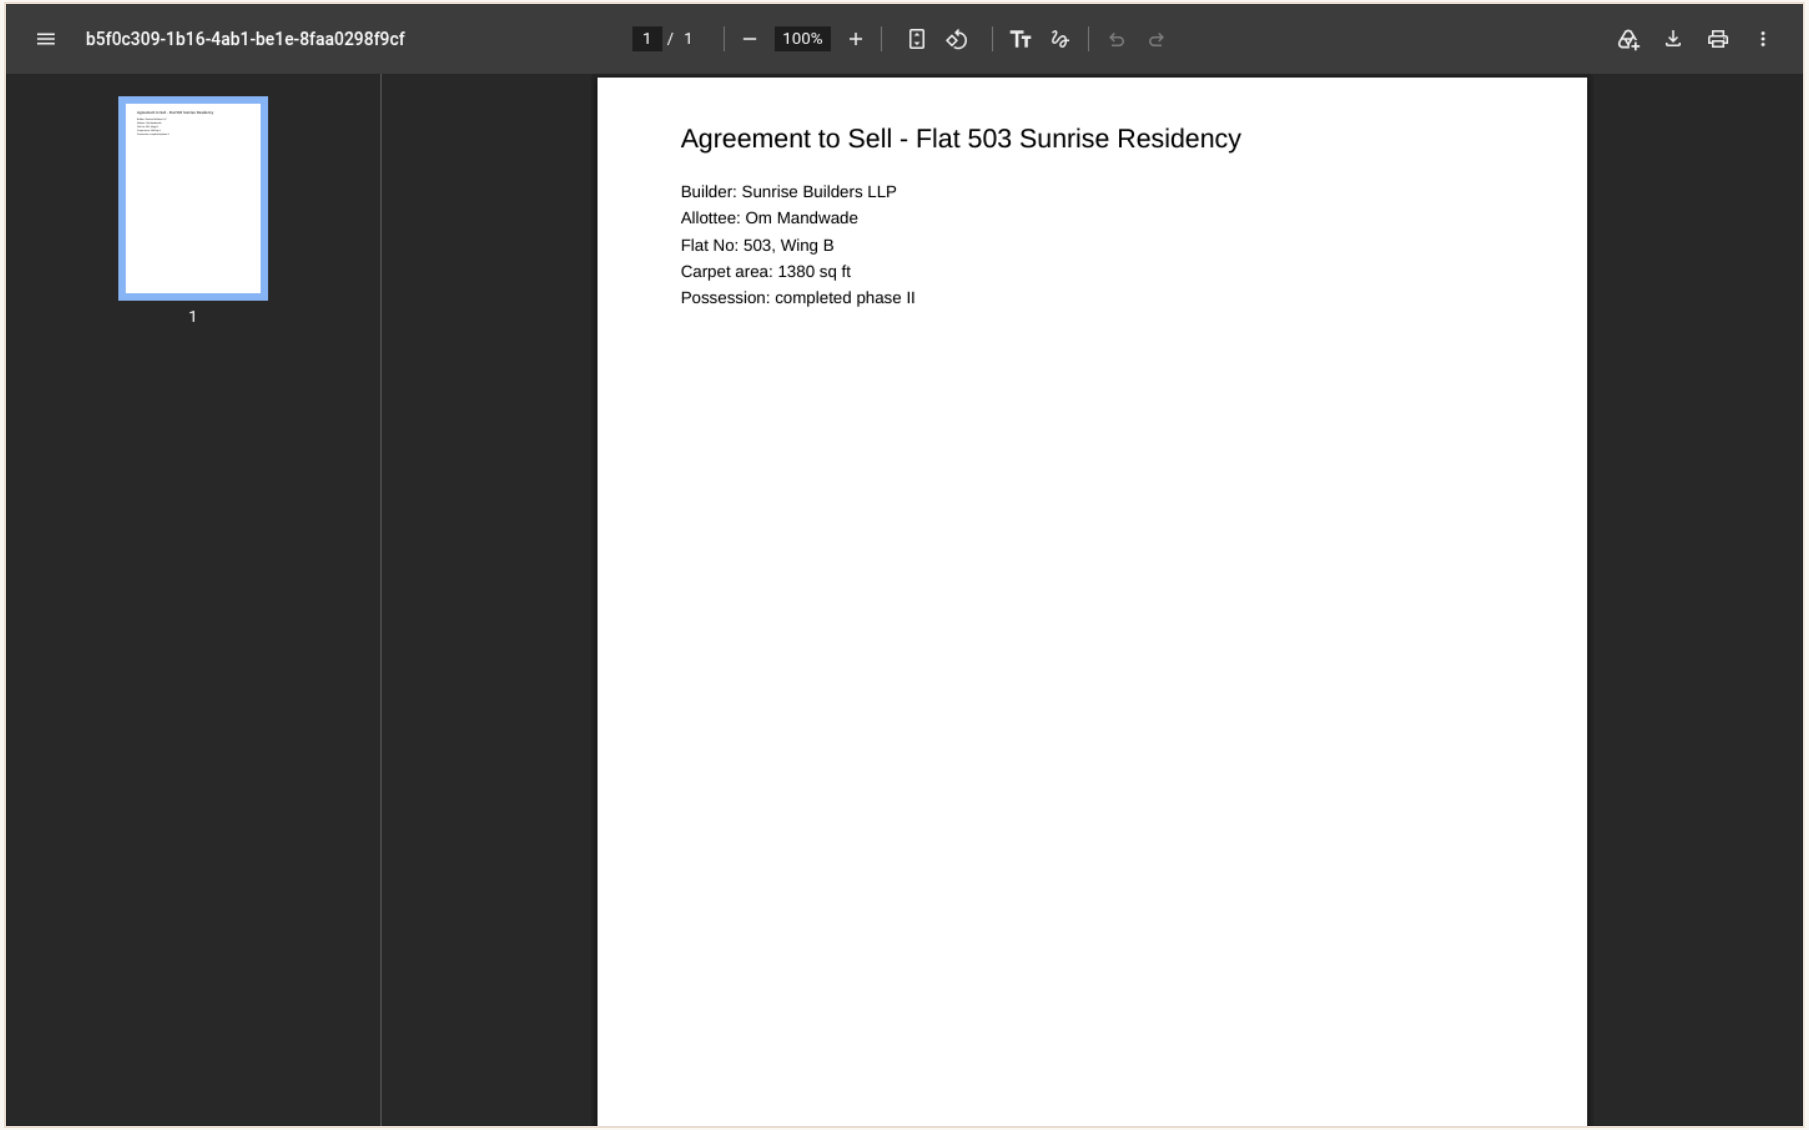

One click re-computes the document's SHA-256 and compares it against the fingerprint sealed at submission time.

SHA-256 match

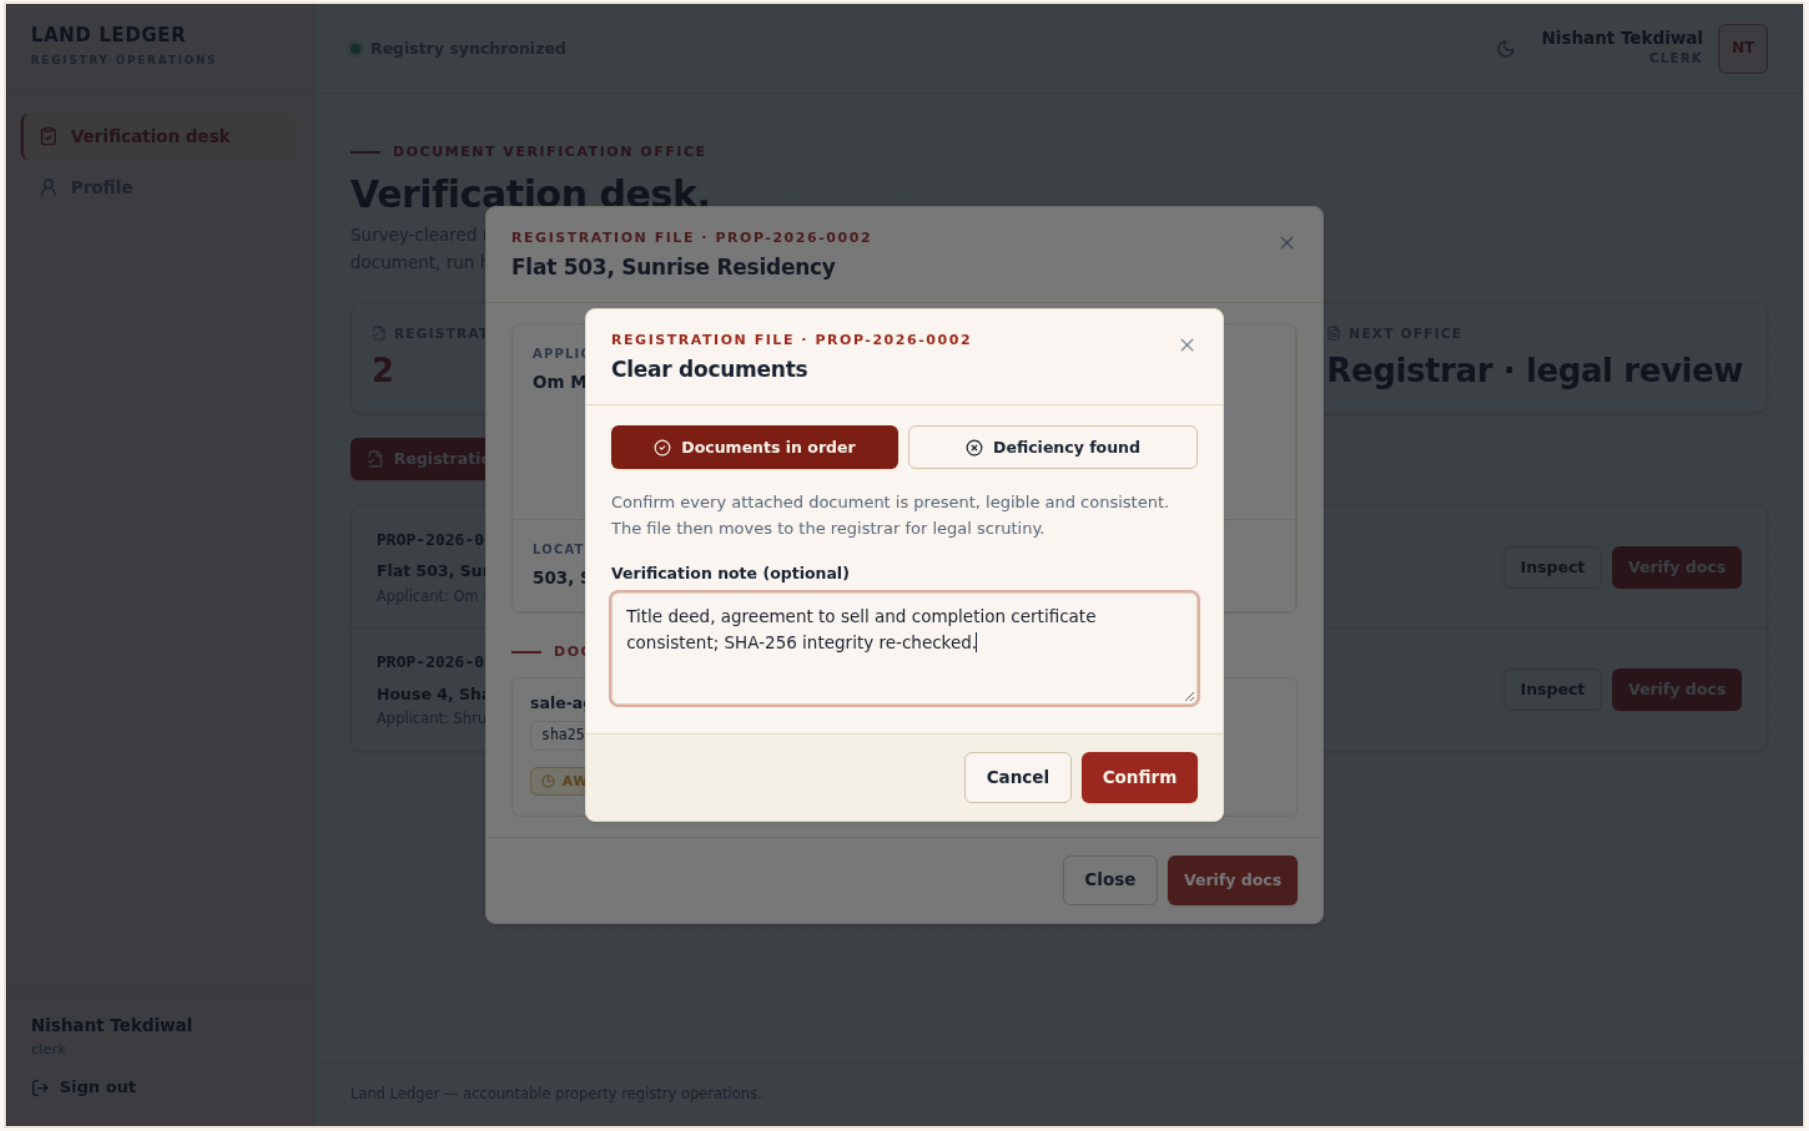

Integrity verified - the fingerprints match. The document is byte-for-byte what the citizen uploaded; nothing was swapped en route.

The actual PDF

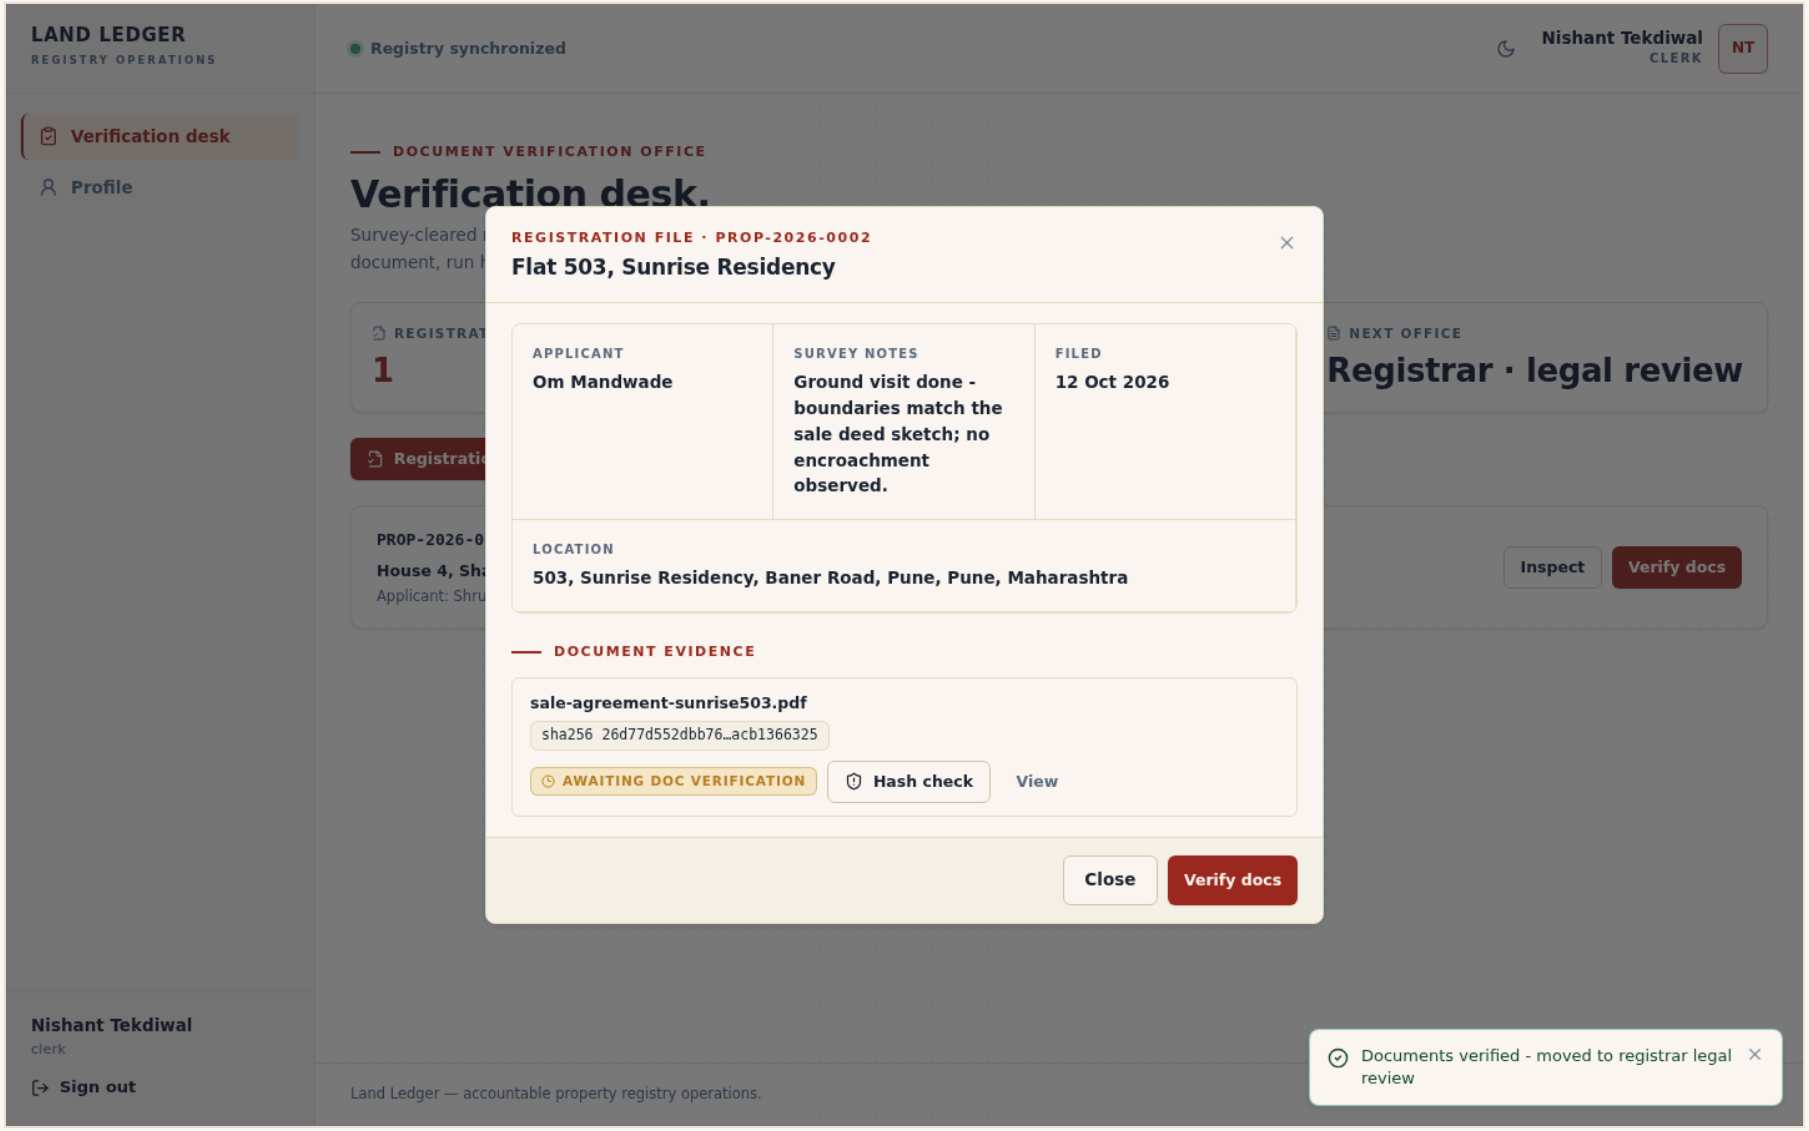

View opens the real Agreement to Sell in a new tab - the document itself, not a placeholder. Office staff have full document access by design.

Verify with a note

Confirming verification with a note: documents in order. The formal record that this office checked the paperwork.

Cleared for registrar

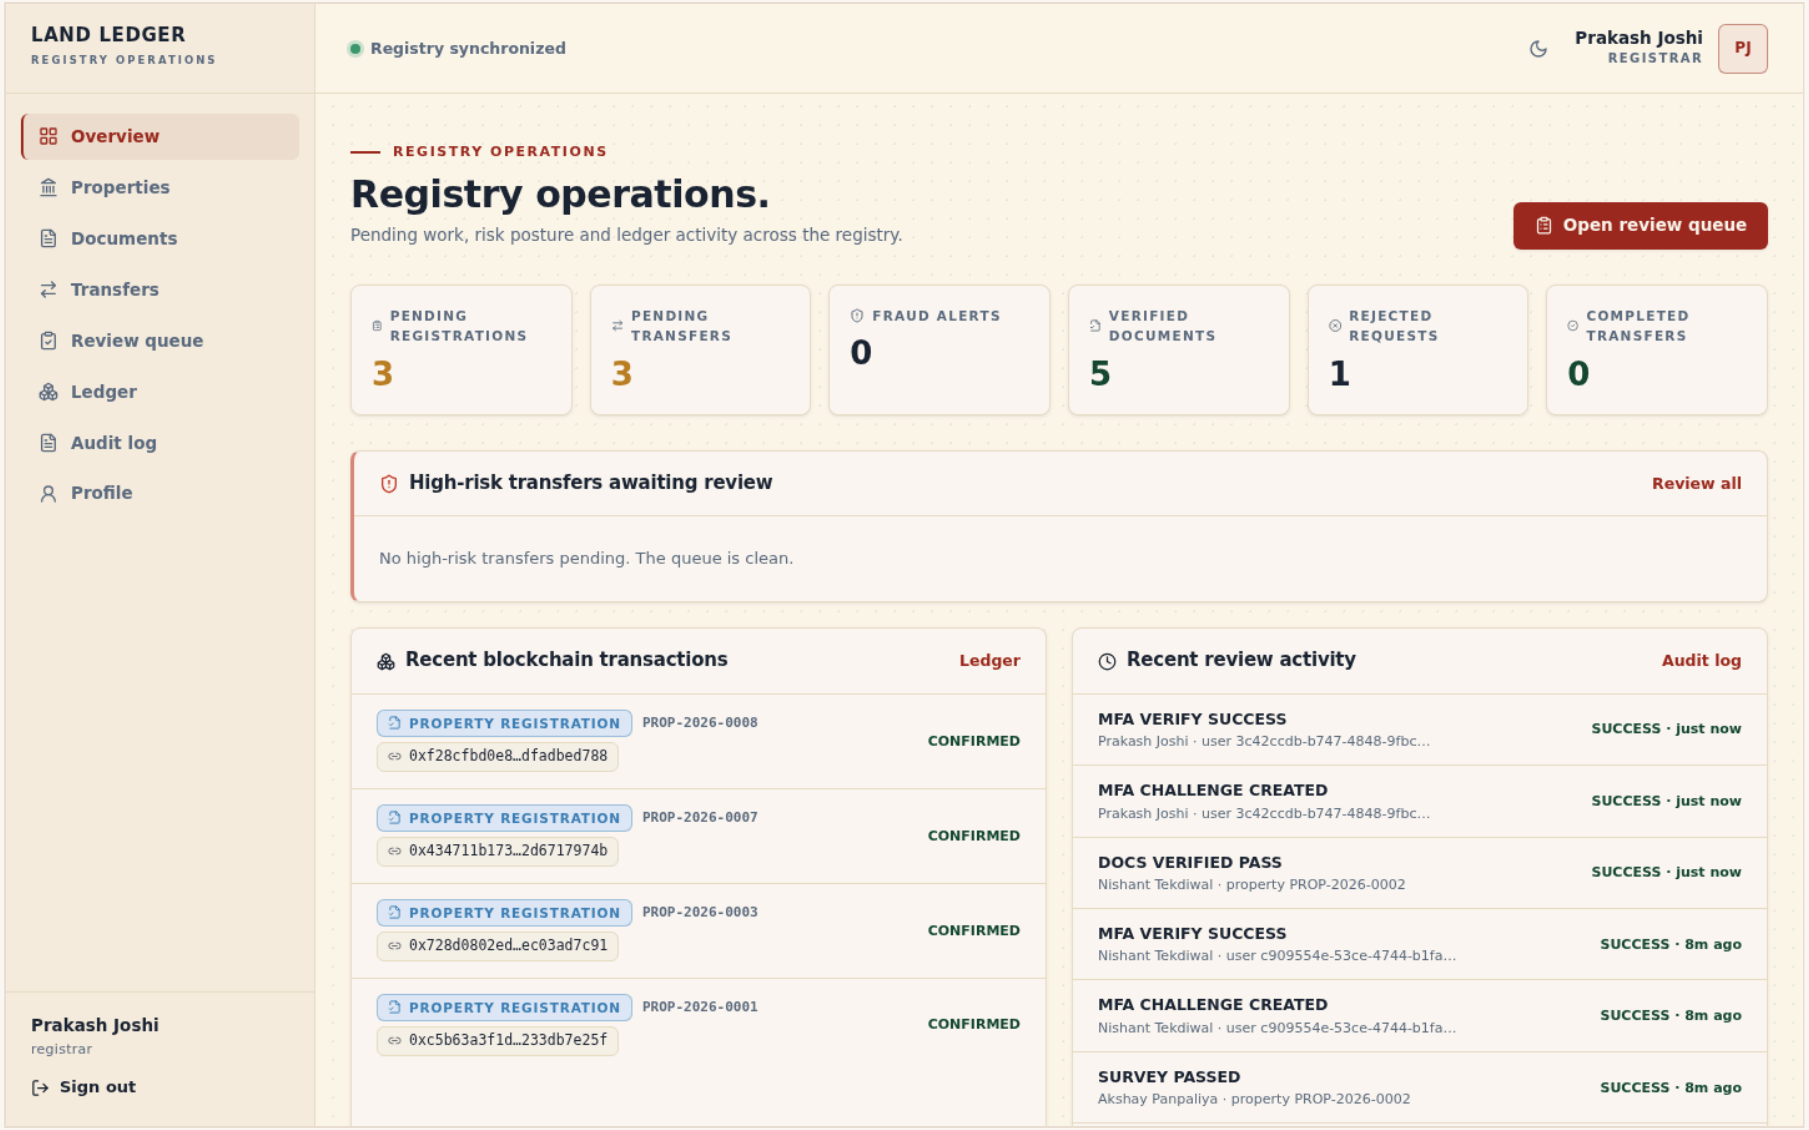

Cleared for the registrar - the desk is done and the case advances to legal review.

ACT 09 · SCREENS 47-58

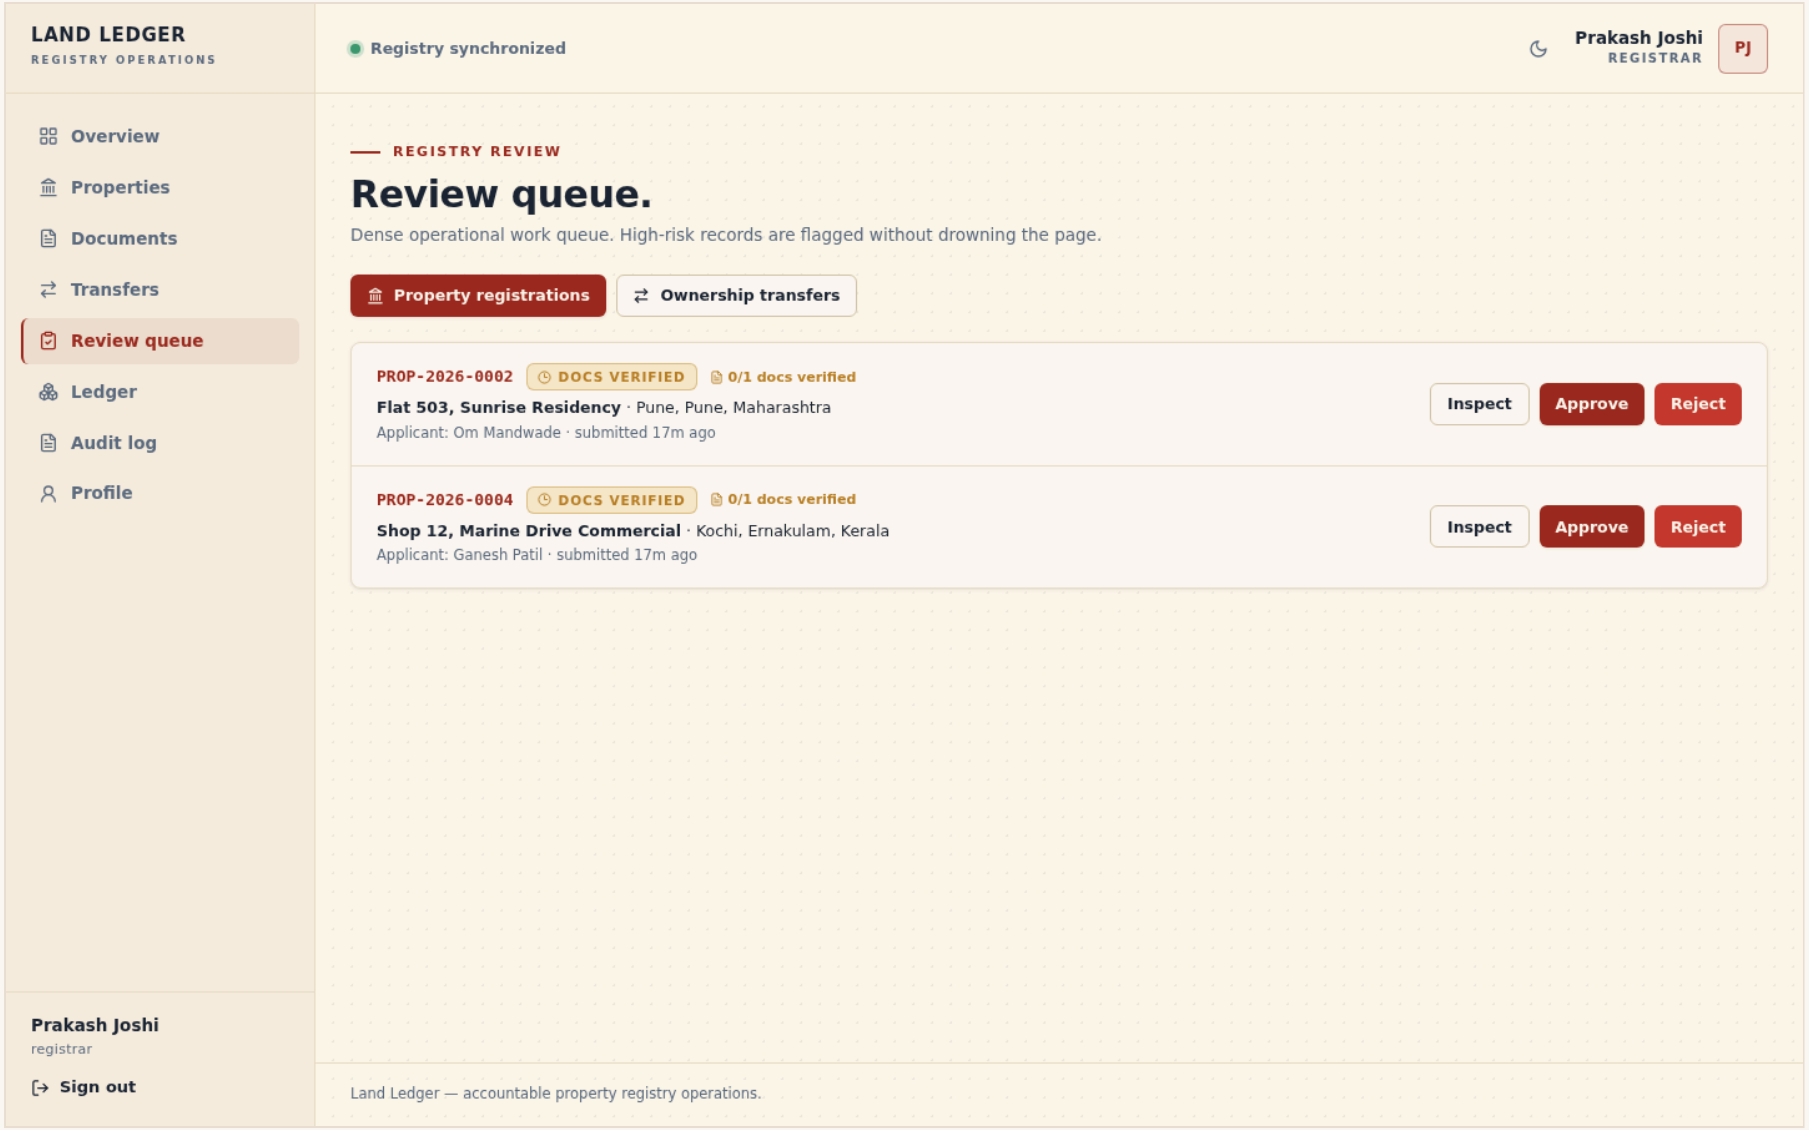

The registrar and the ledger

09

The registrar holds the pen that writes to the blockchain. His approval mints the registration on-chain - block, transaction hash, timestamp - and the property's ownership history updates forever. This is the payoff moment of the entire demo; let the ledger screenshot sit on screen while you say it.

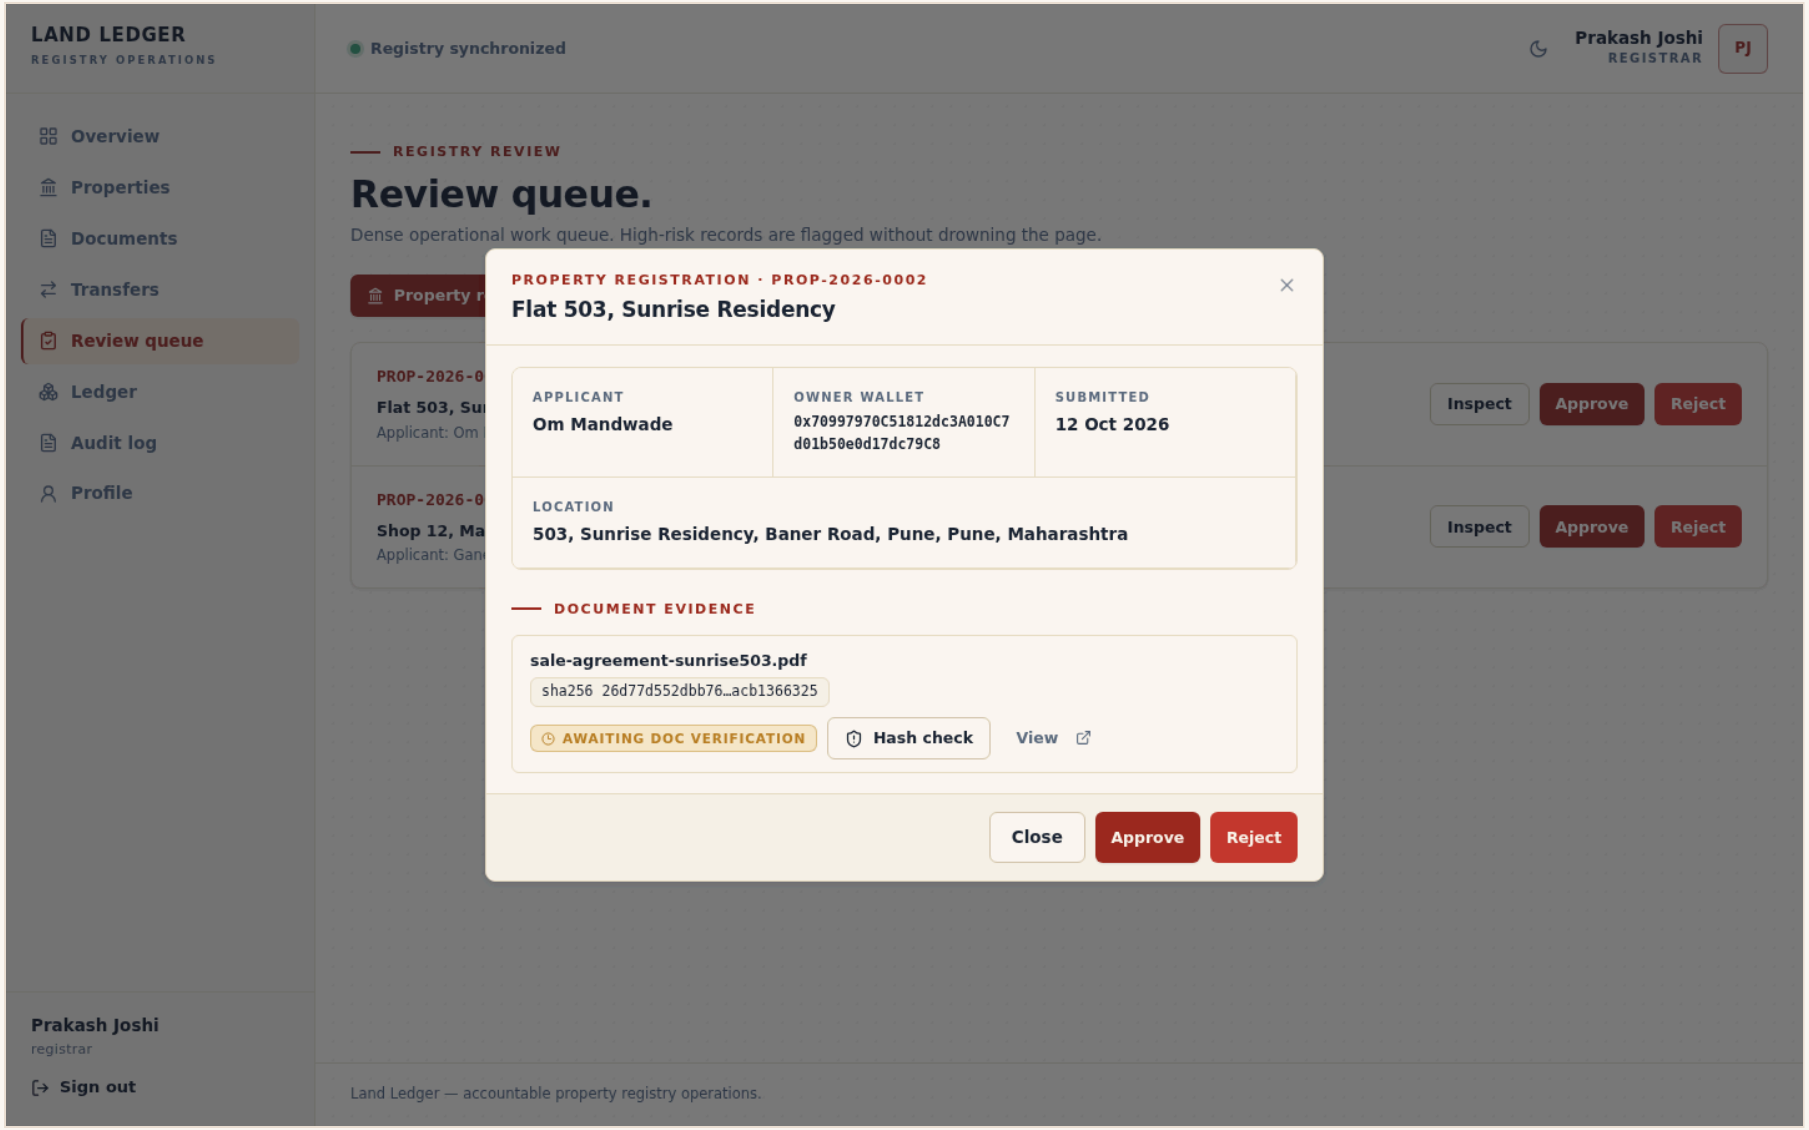

The registrar's operations dashboard: registry-wide status, queues and chain health at the top of the office hierarchy.

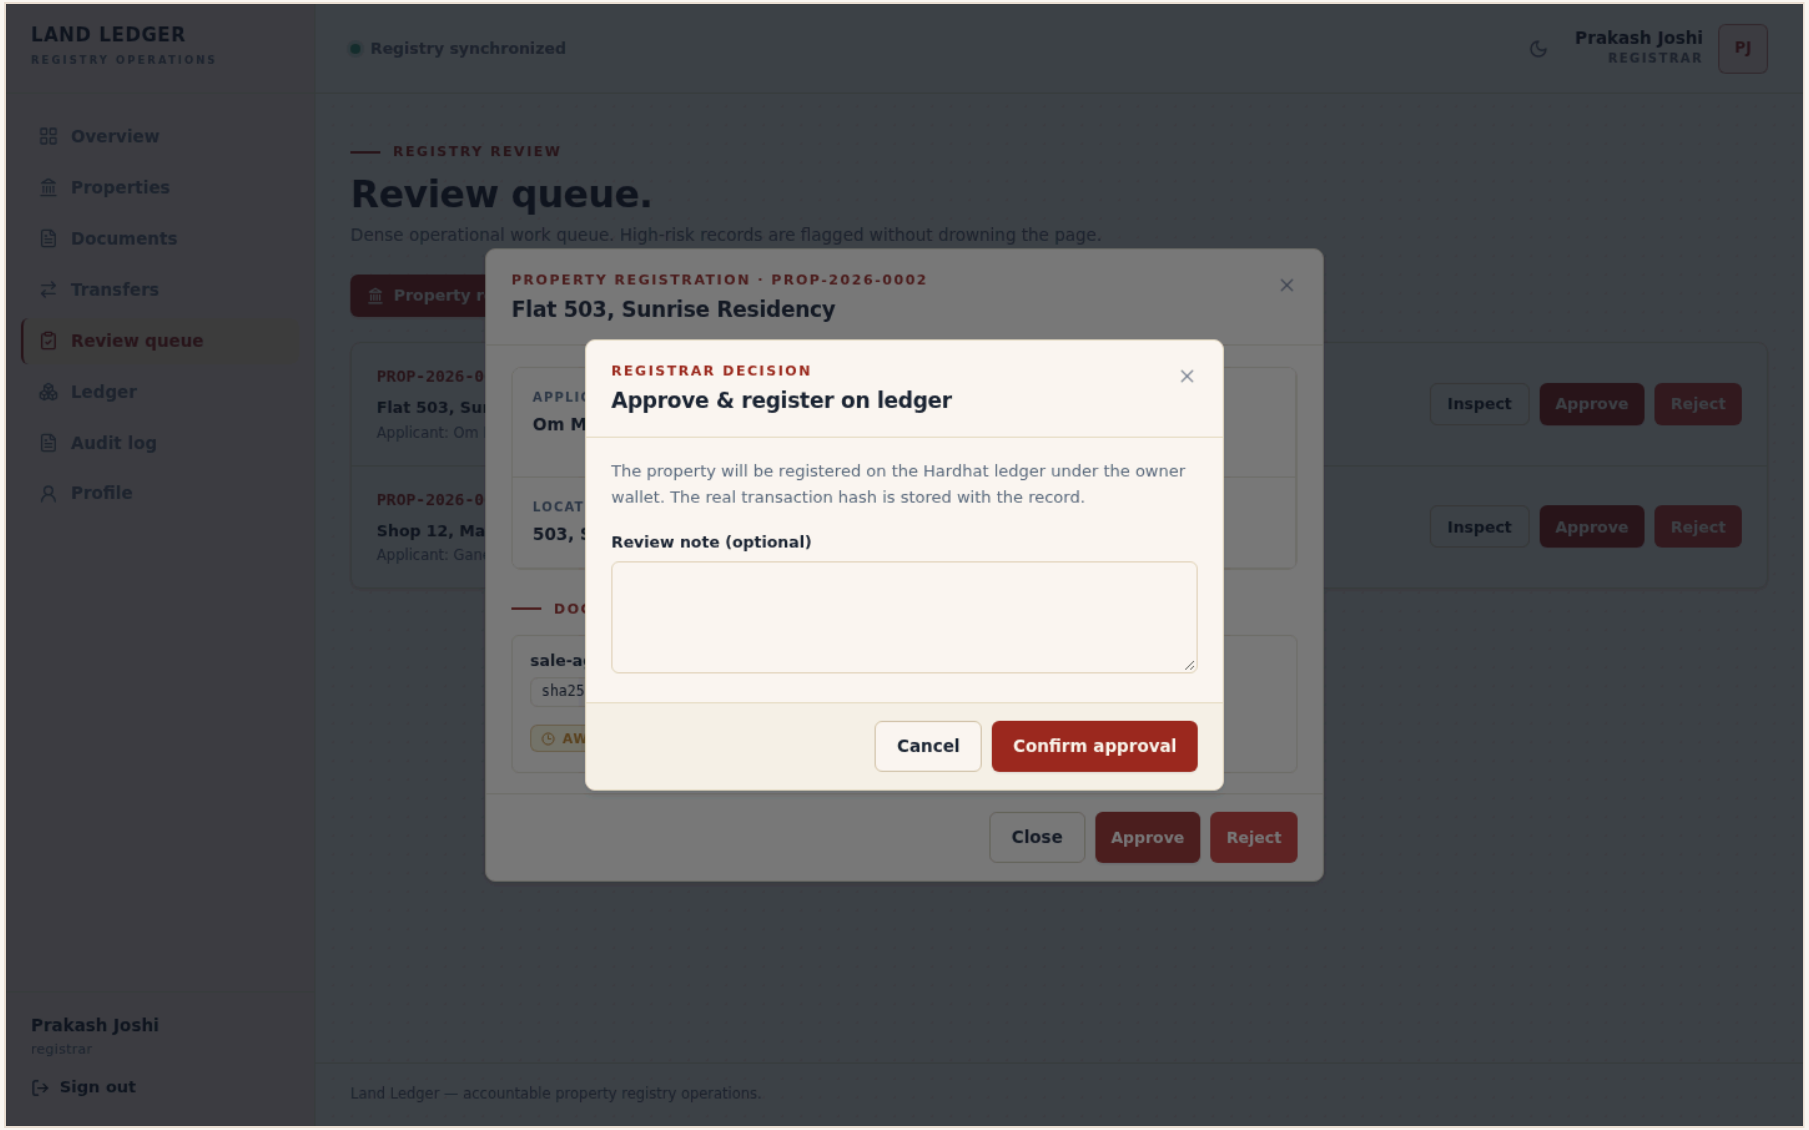

The legal review queue: verification-cleared cases awaiting the registrar's final decision.

Final inspection

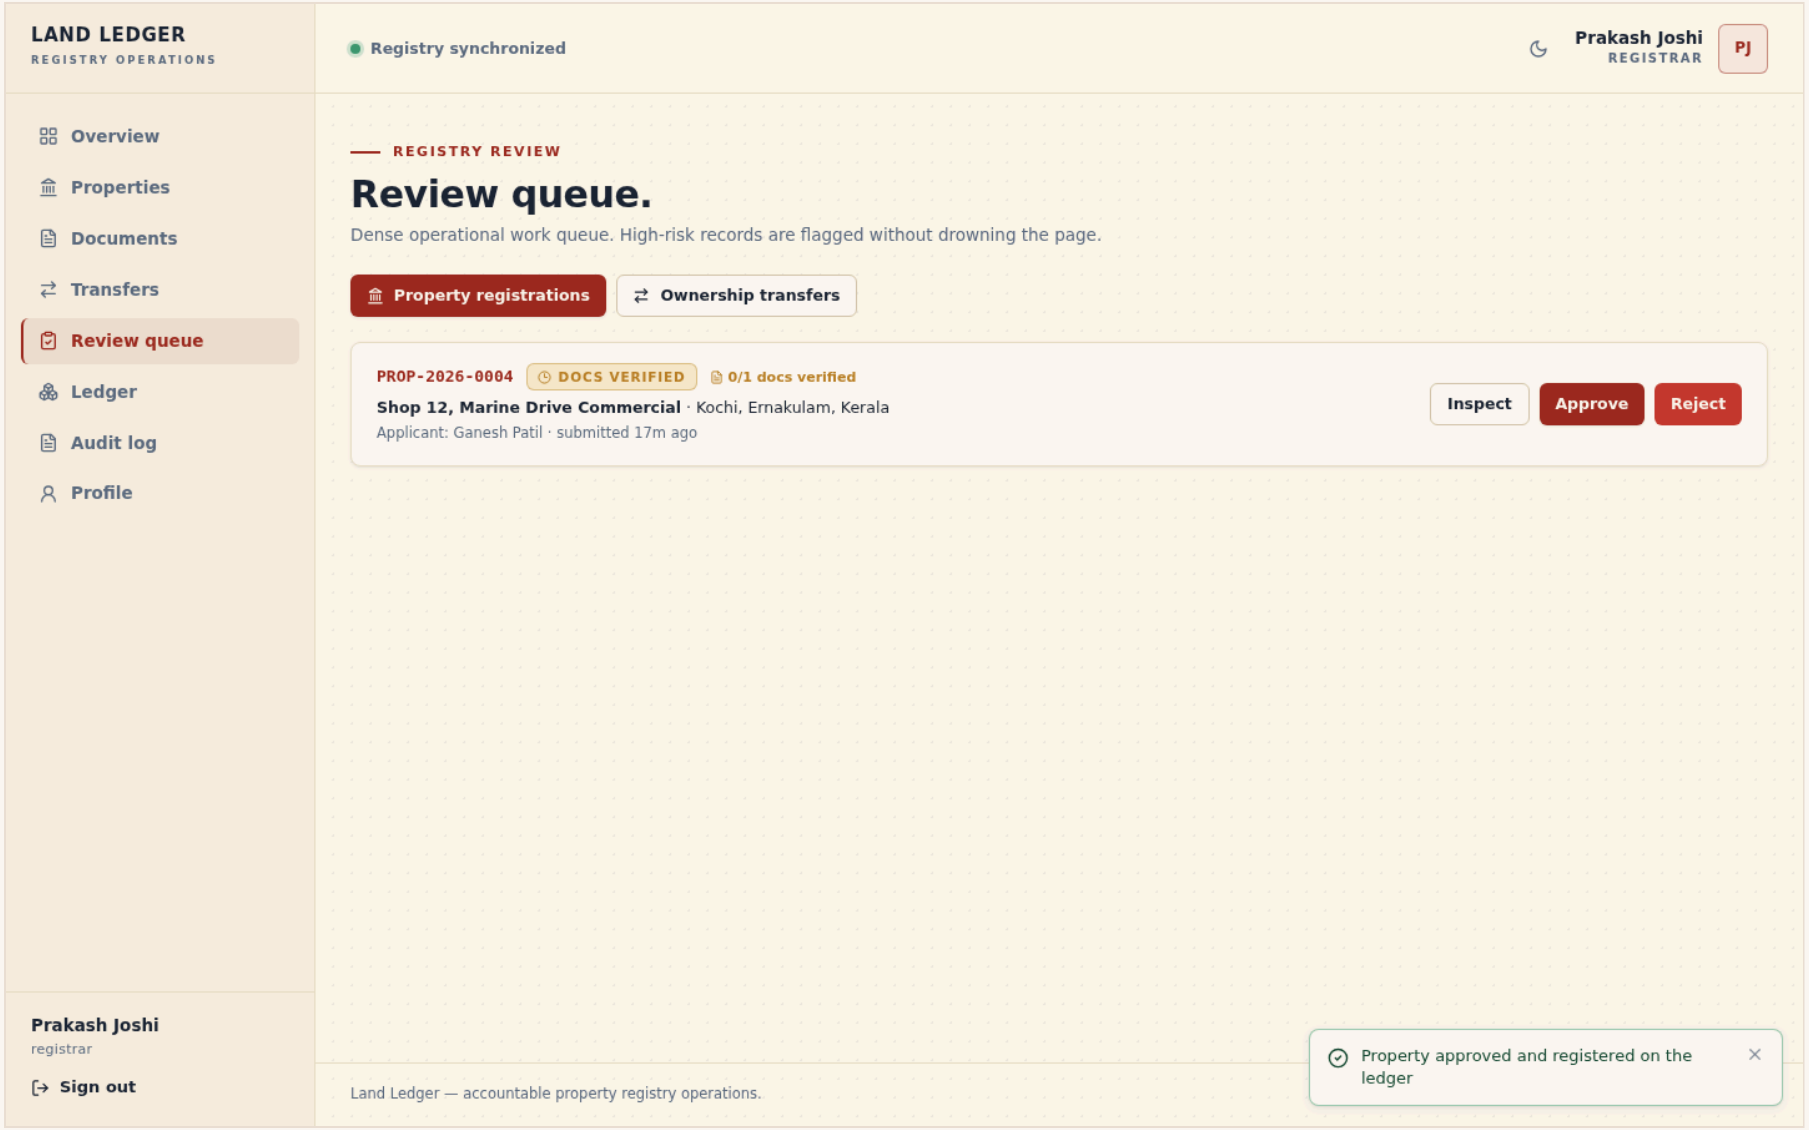

Final inspection of the file - every prior office's work, from survey notes to hash verification, is visible before he signs.

Approve and register

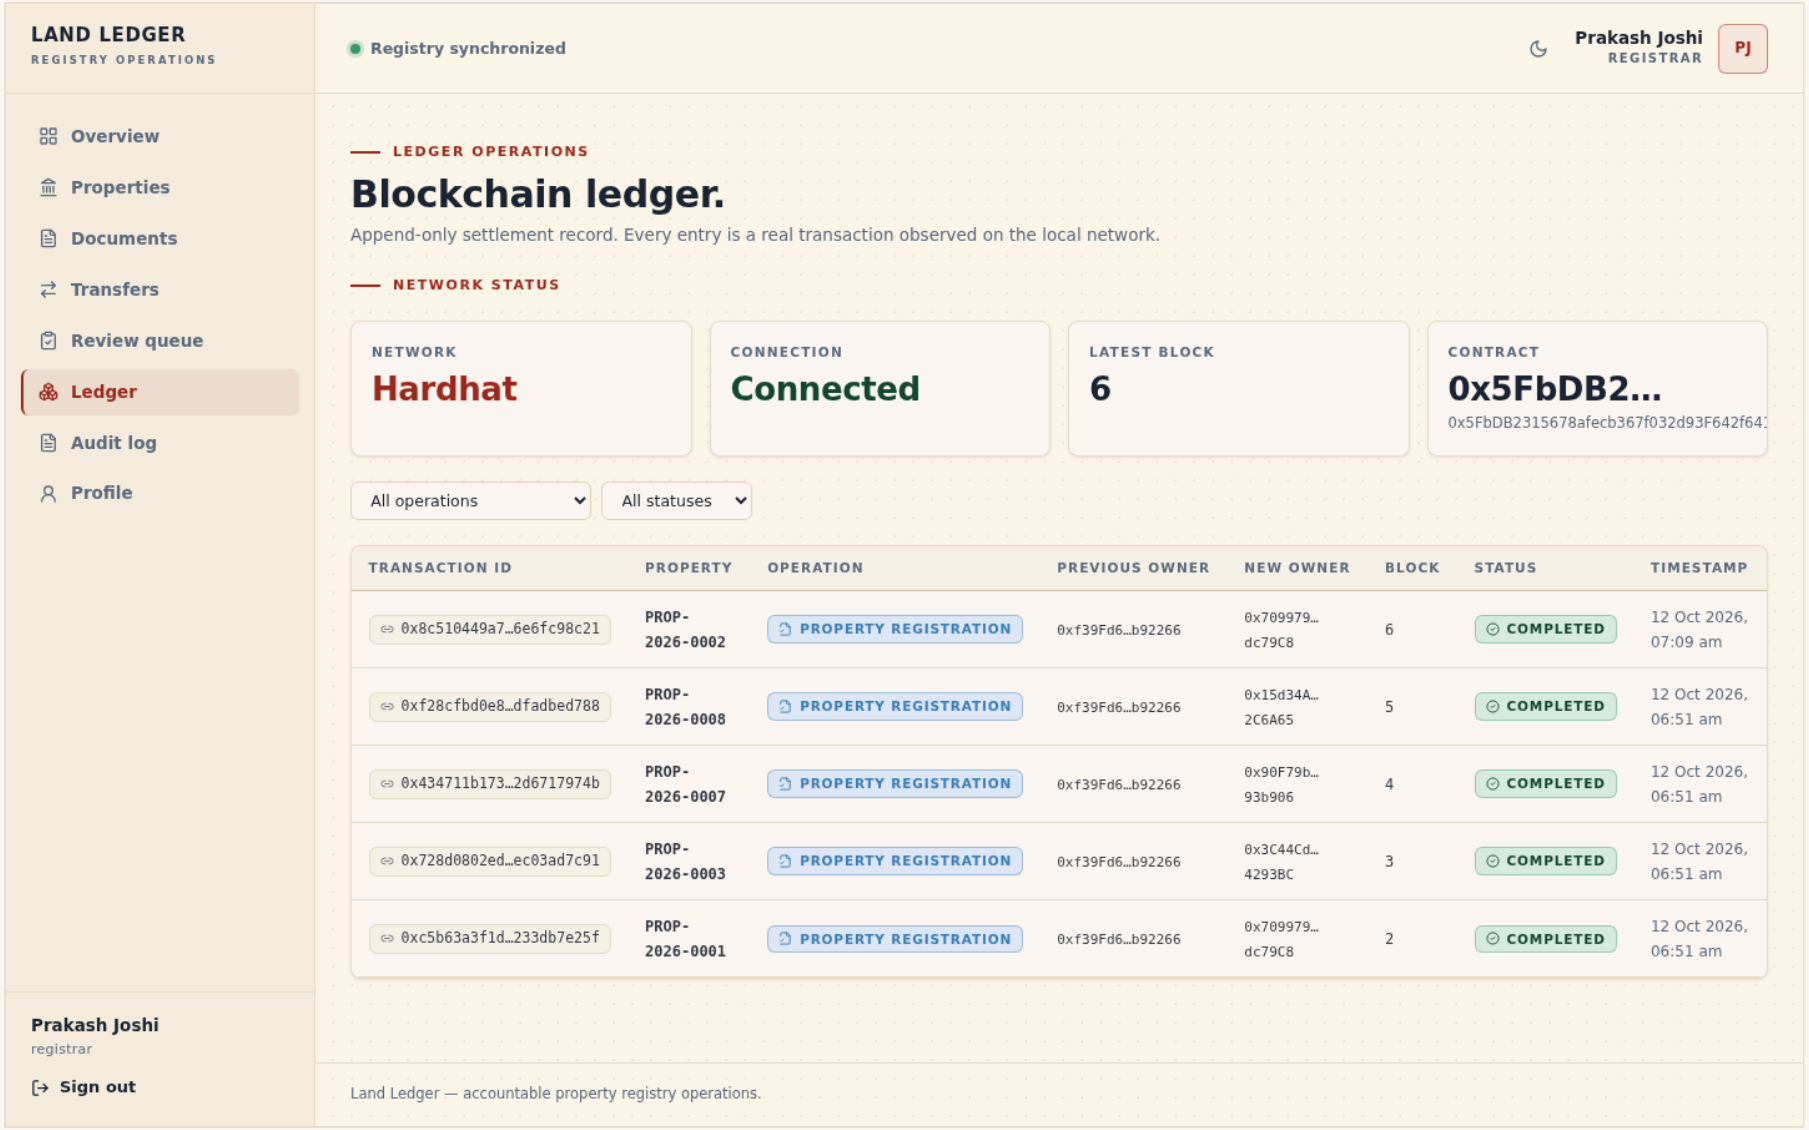

The decisive moment: approve and register on ledger. This dialog commits the registration to the blockchain.

Registered

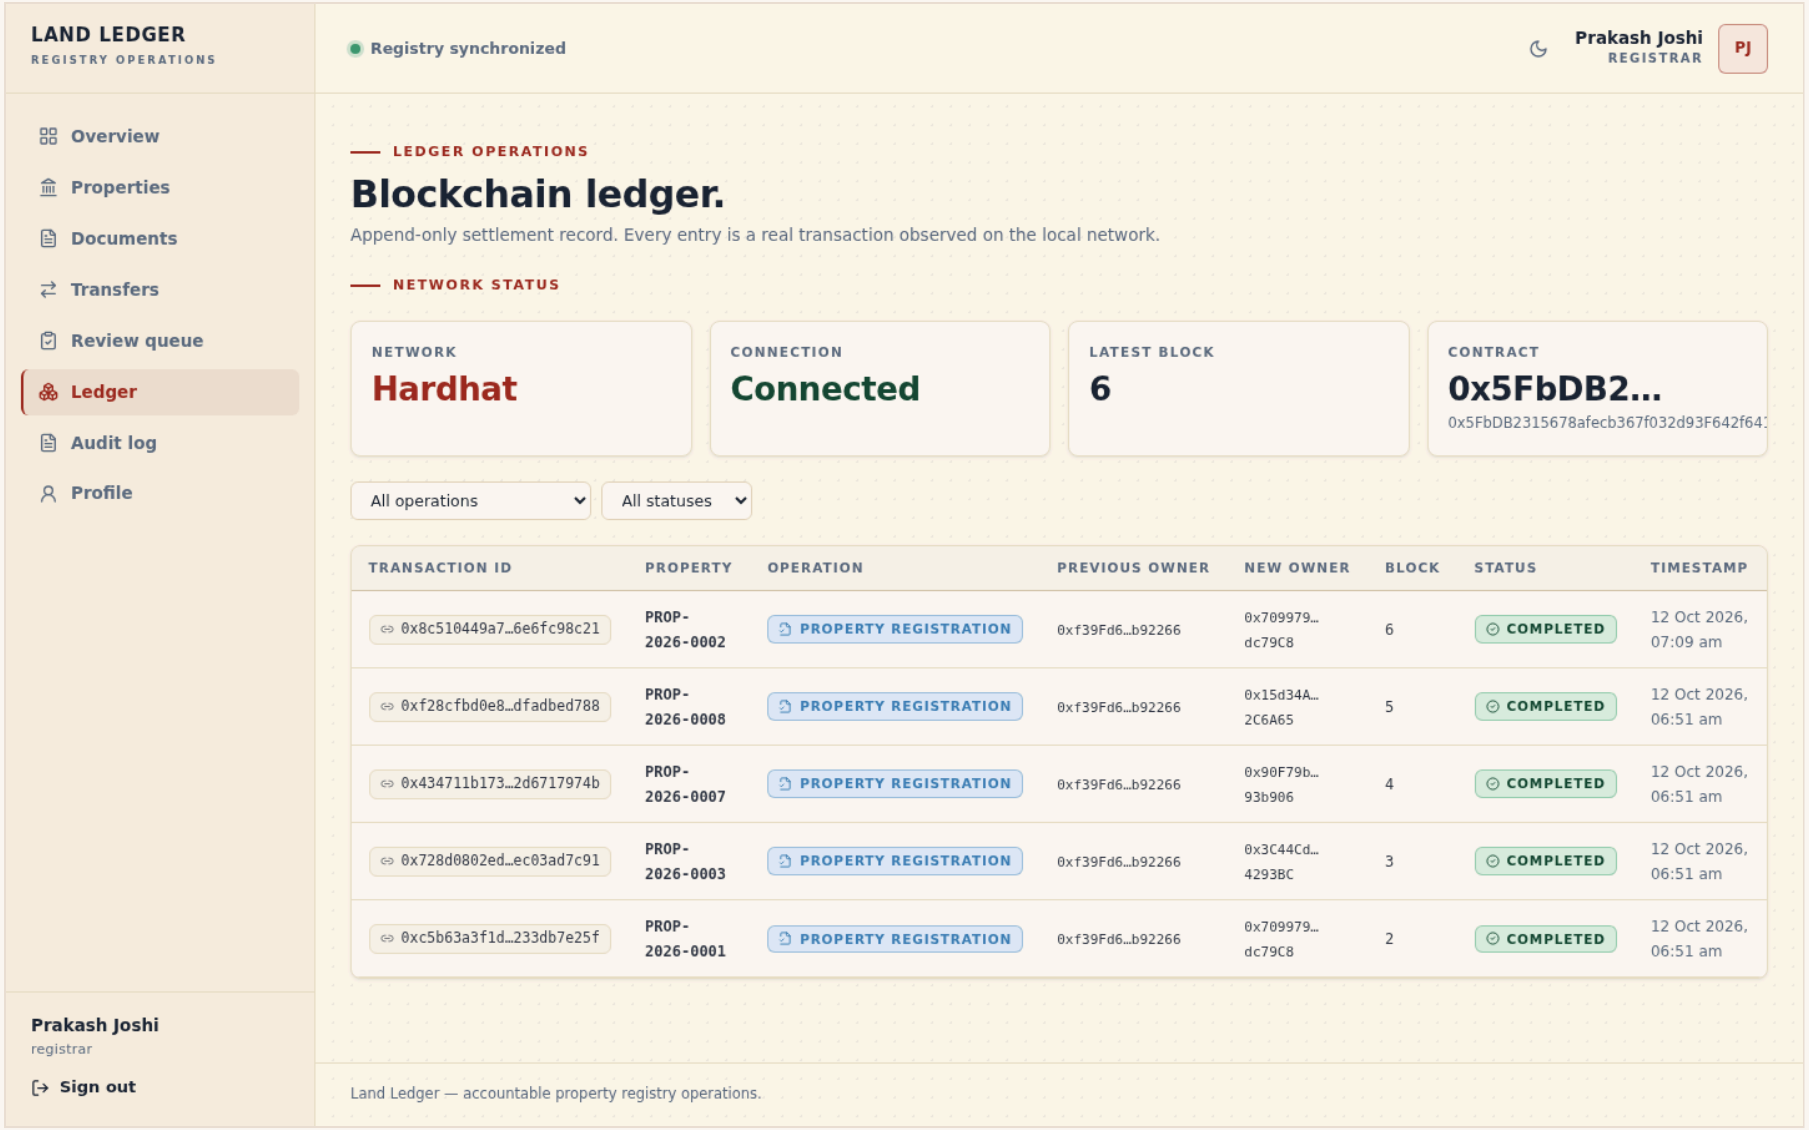

Registered. The property's status flips to REGISTERED and the transaction is anchored on-chain in the same action.

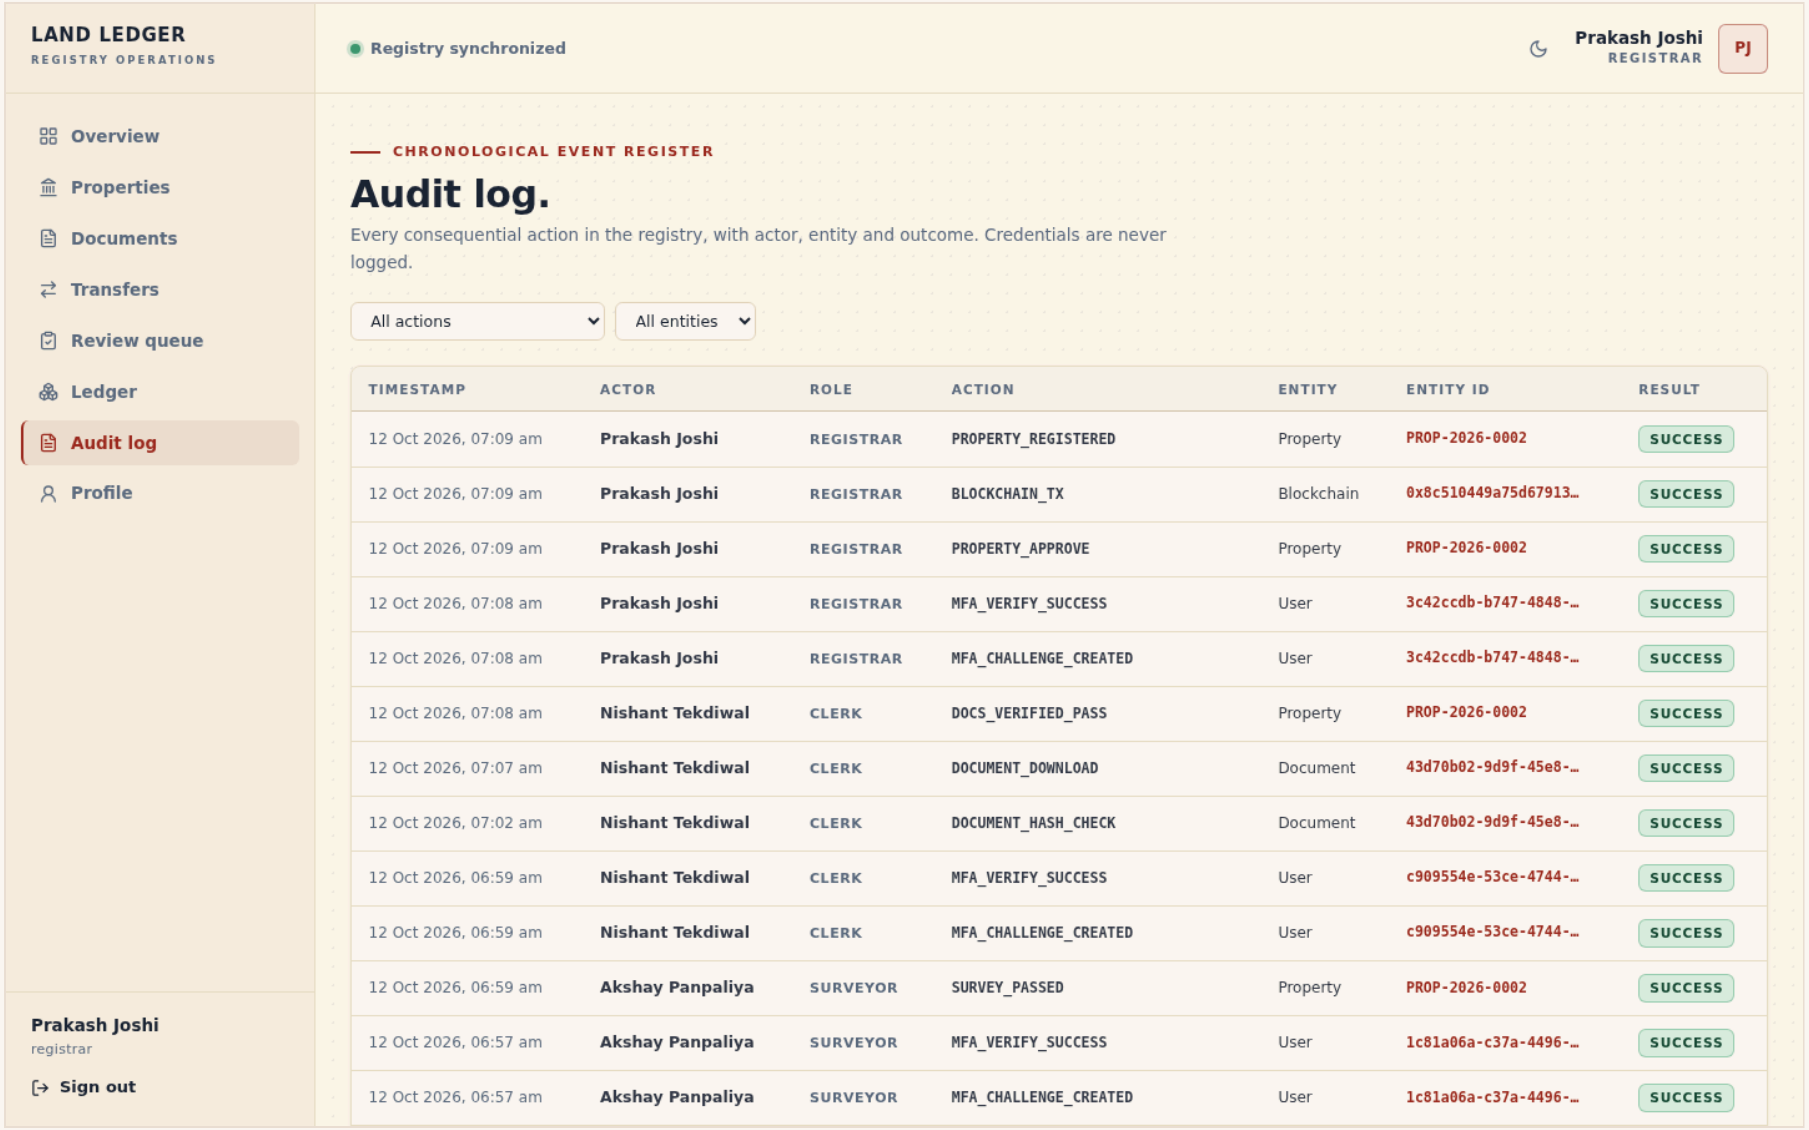

The ledger explorer confirms it: a fresh block carrying the registration event, visible to every office and citizen.

Blocks and tx hashes

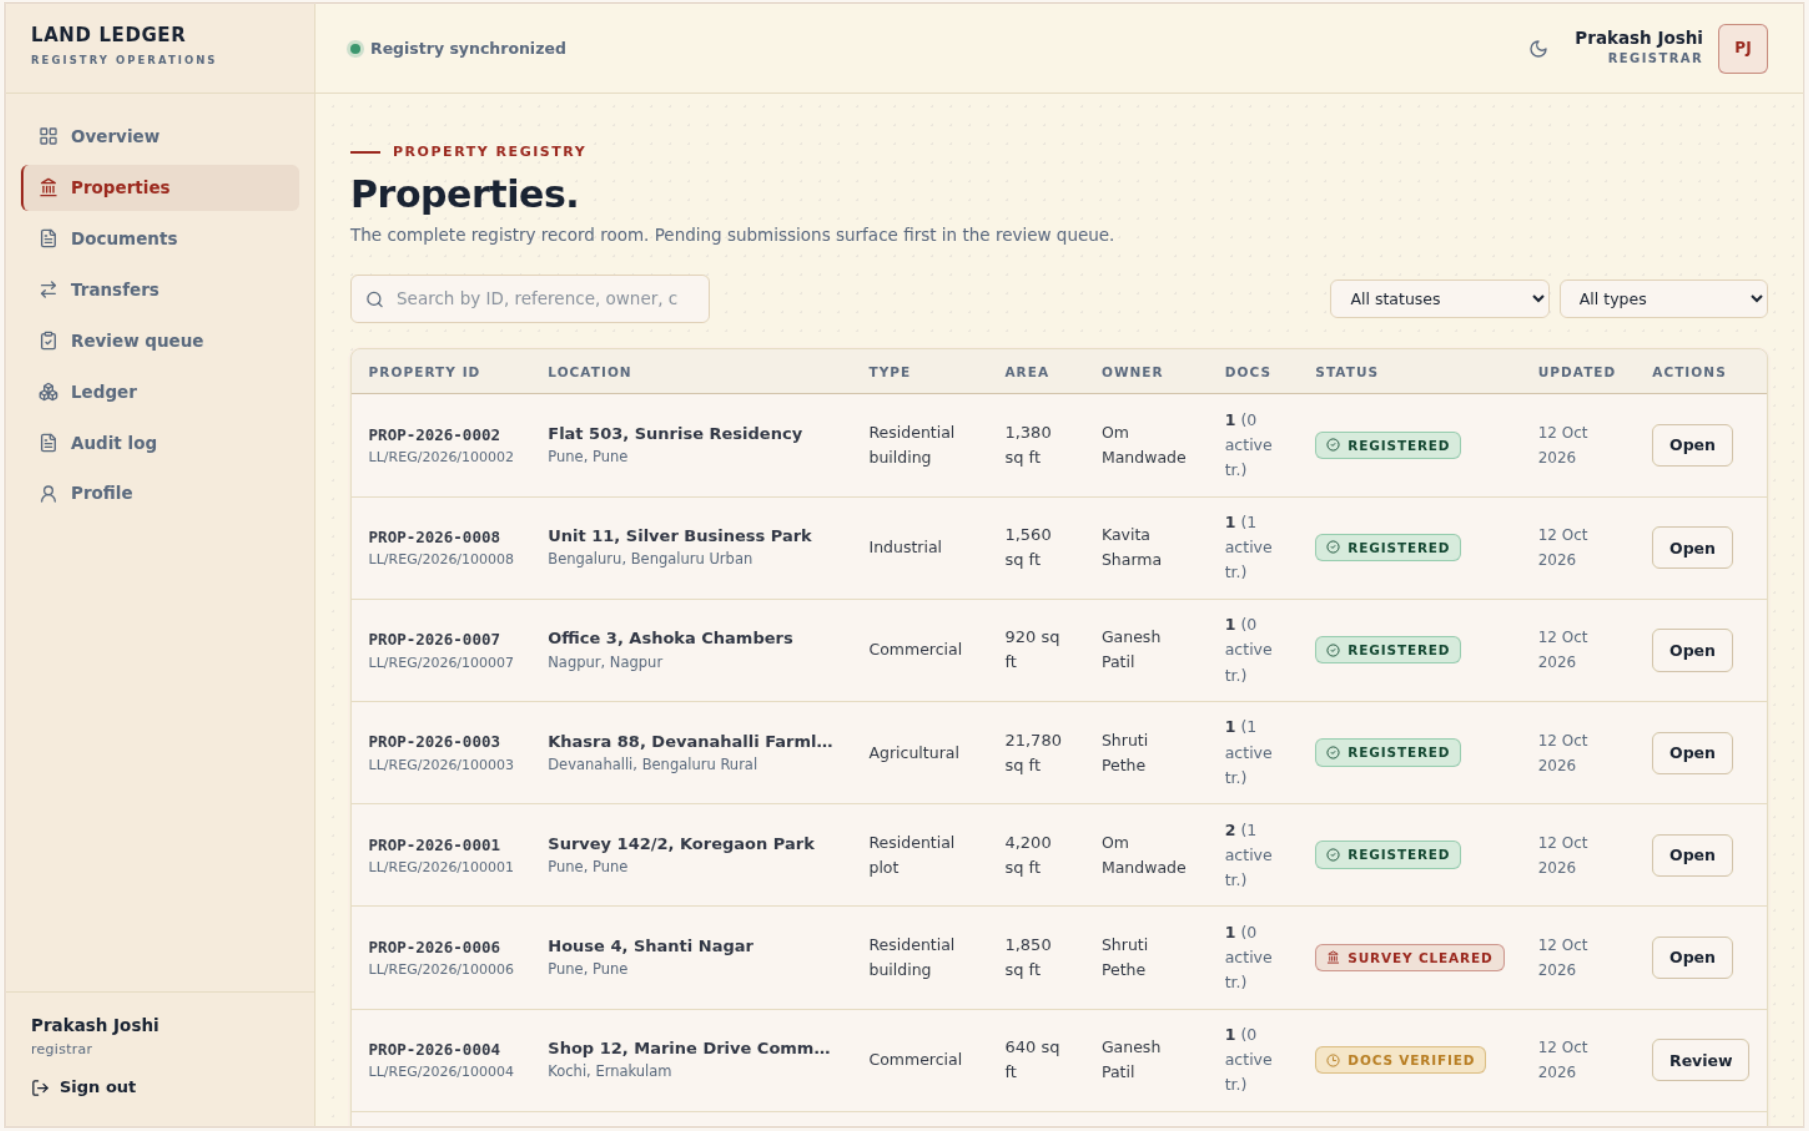

Blocks with transaction hashes and timestamps - the registry's history, immutable and inspectable, block by block.

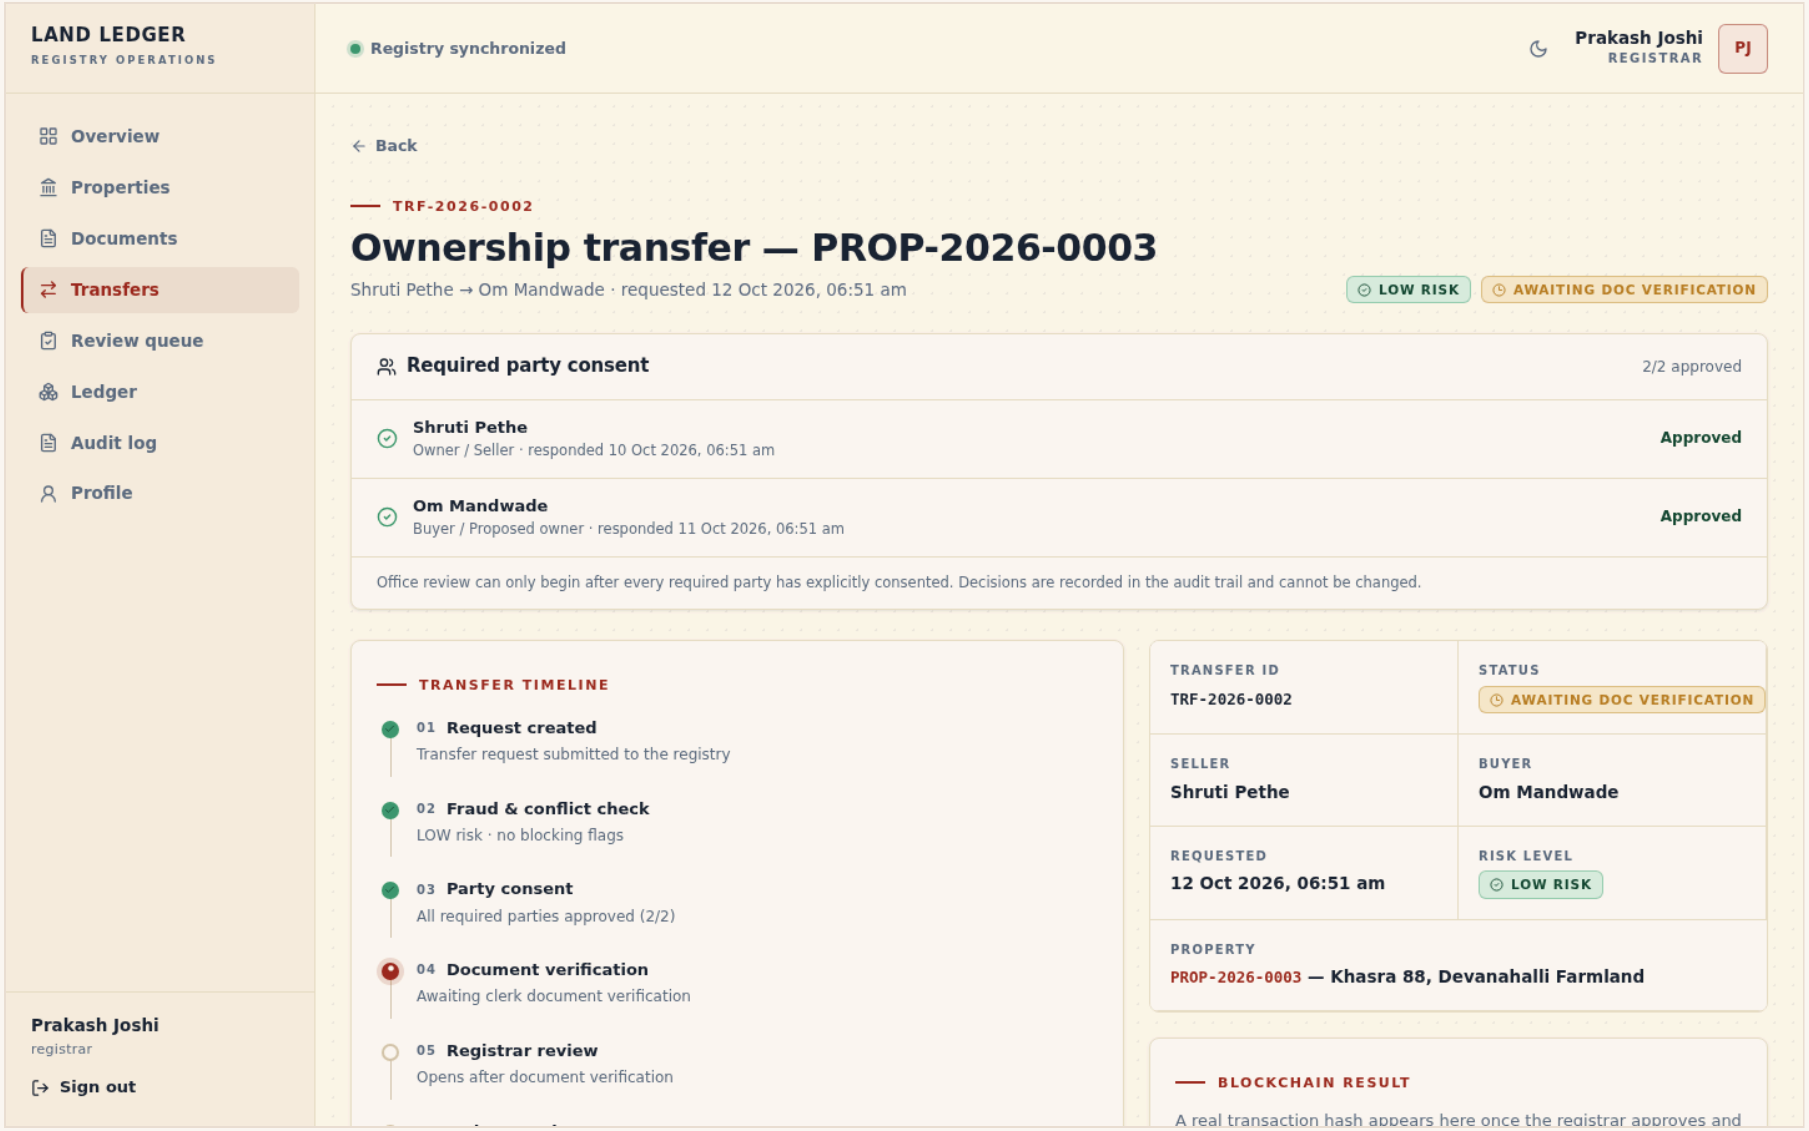

The audit log: every action by every role, who did what and when. Accountability here is a feature, not an afterthought.

All properties

All properties across the registry with live status badges - the institution's full book of record on one screen.

Transfer legal review

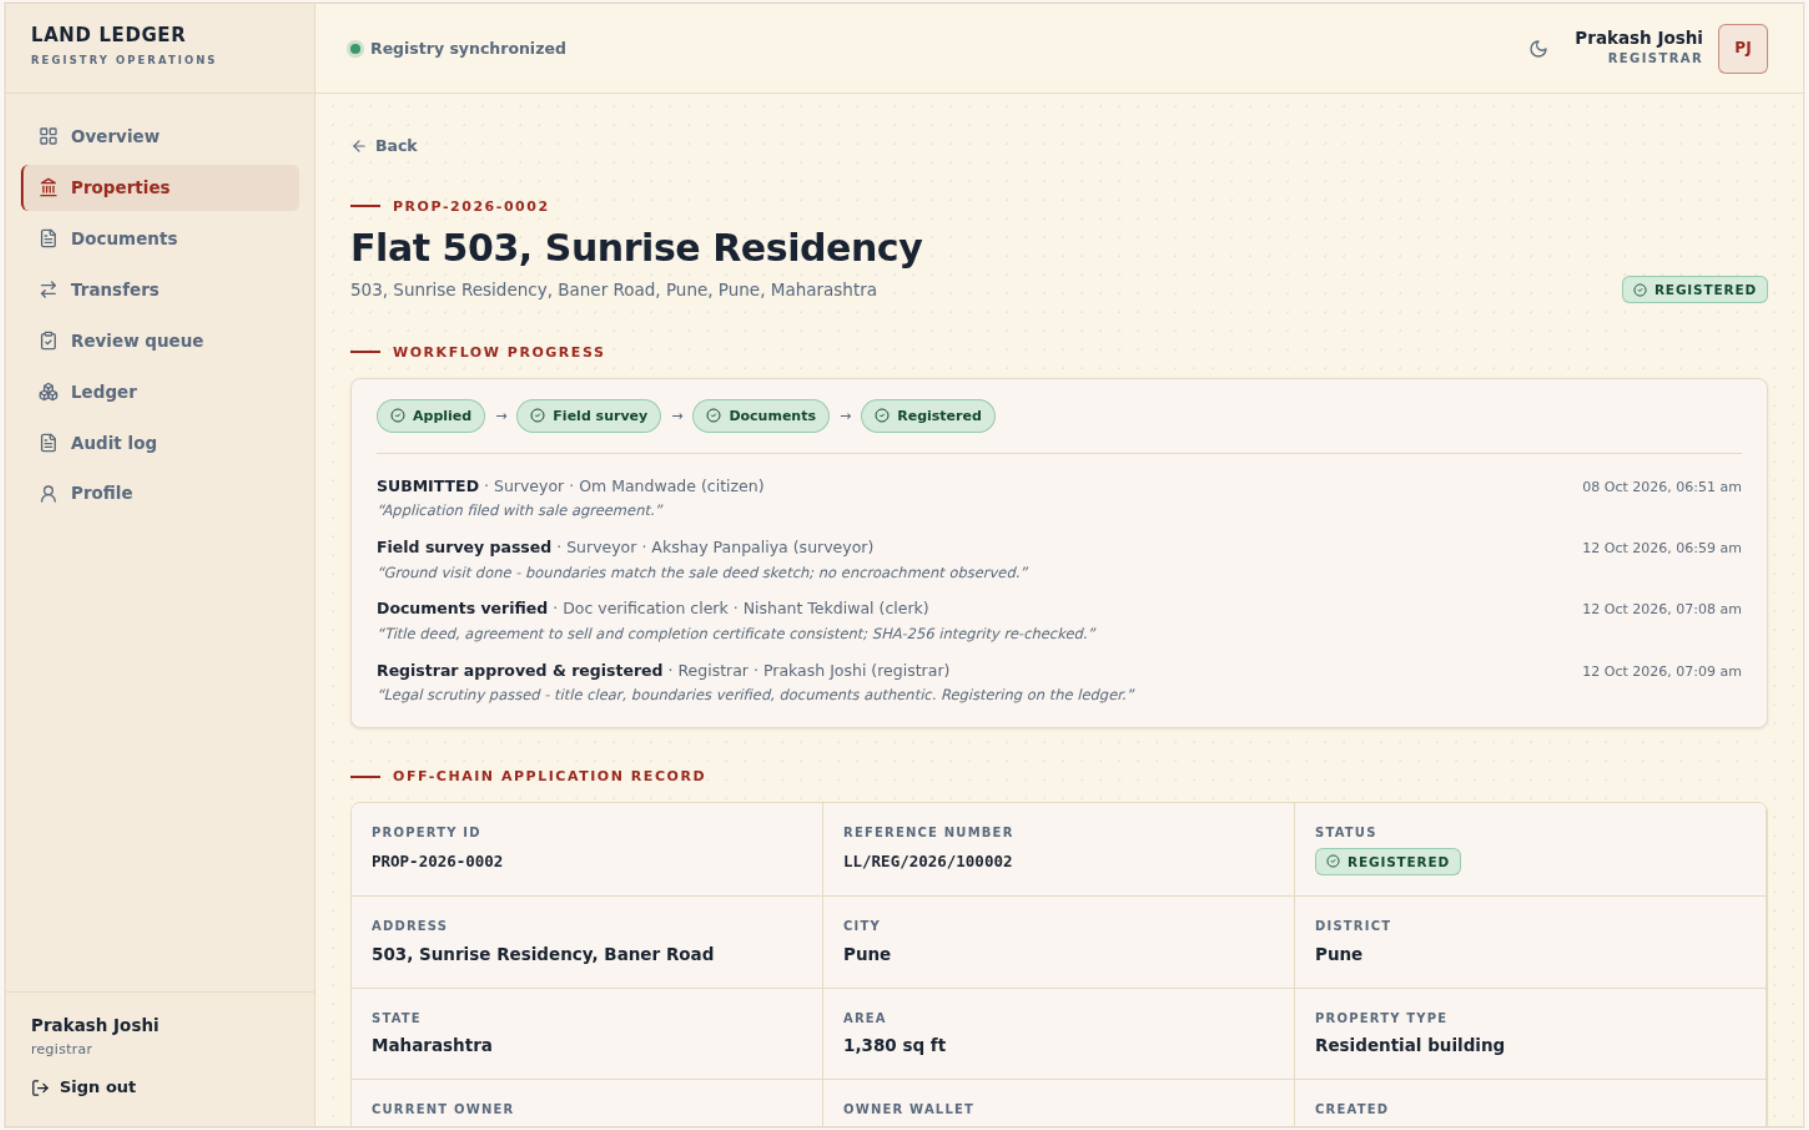

The transfer's legal review view: the registrar sees the complete case before approving the ownership change.

Stage pipeline

The stage pipeline lays out the whole journey - consent, survey, verification, registration - each stage with its owner and timestamp.

On-chain proof

The property file after registration: REGISTERED status plus the on-chain proof - transaction hash, block and time. The system's final word.

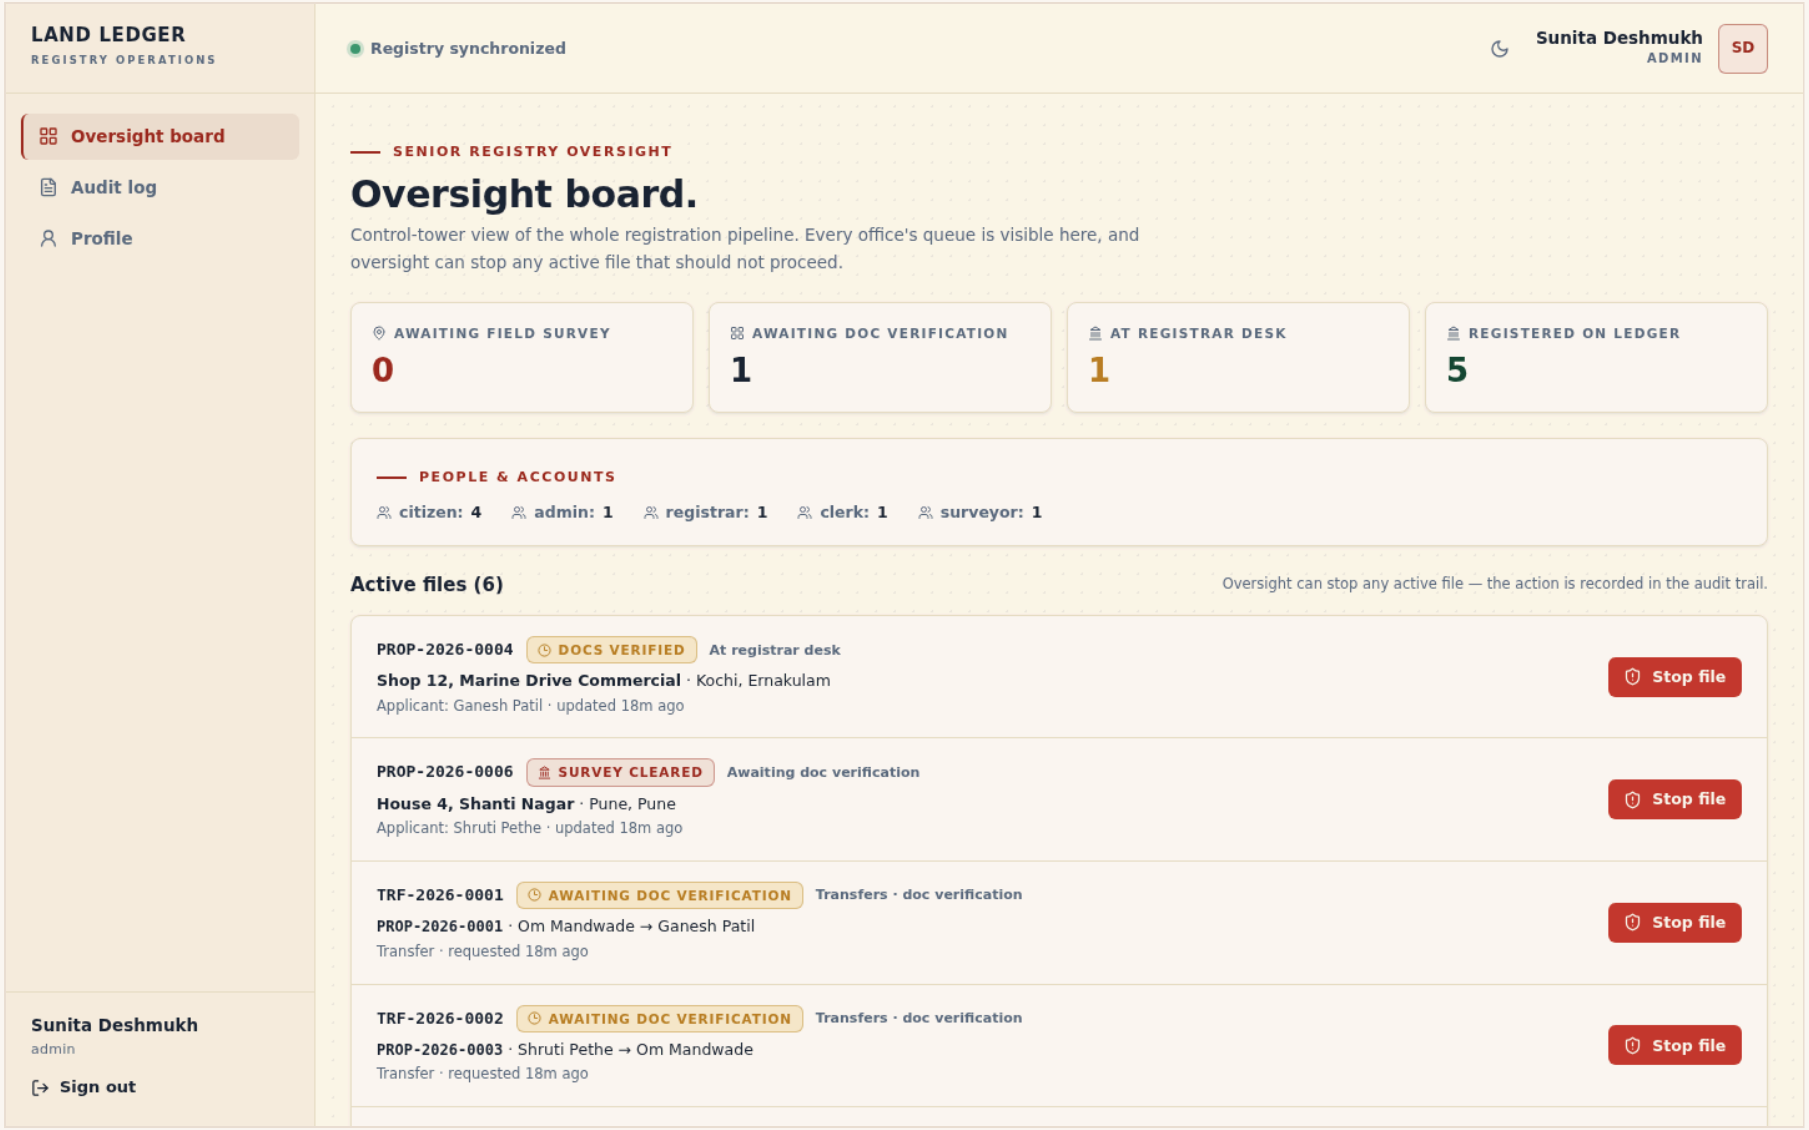

ACT 10 · SCREENS 59-61

Institution oversight

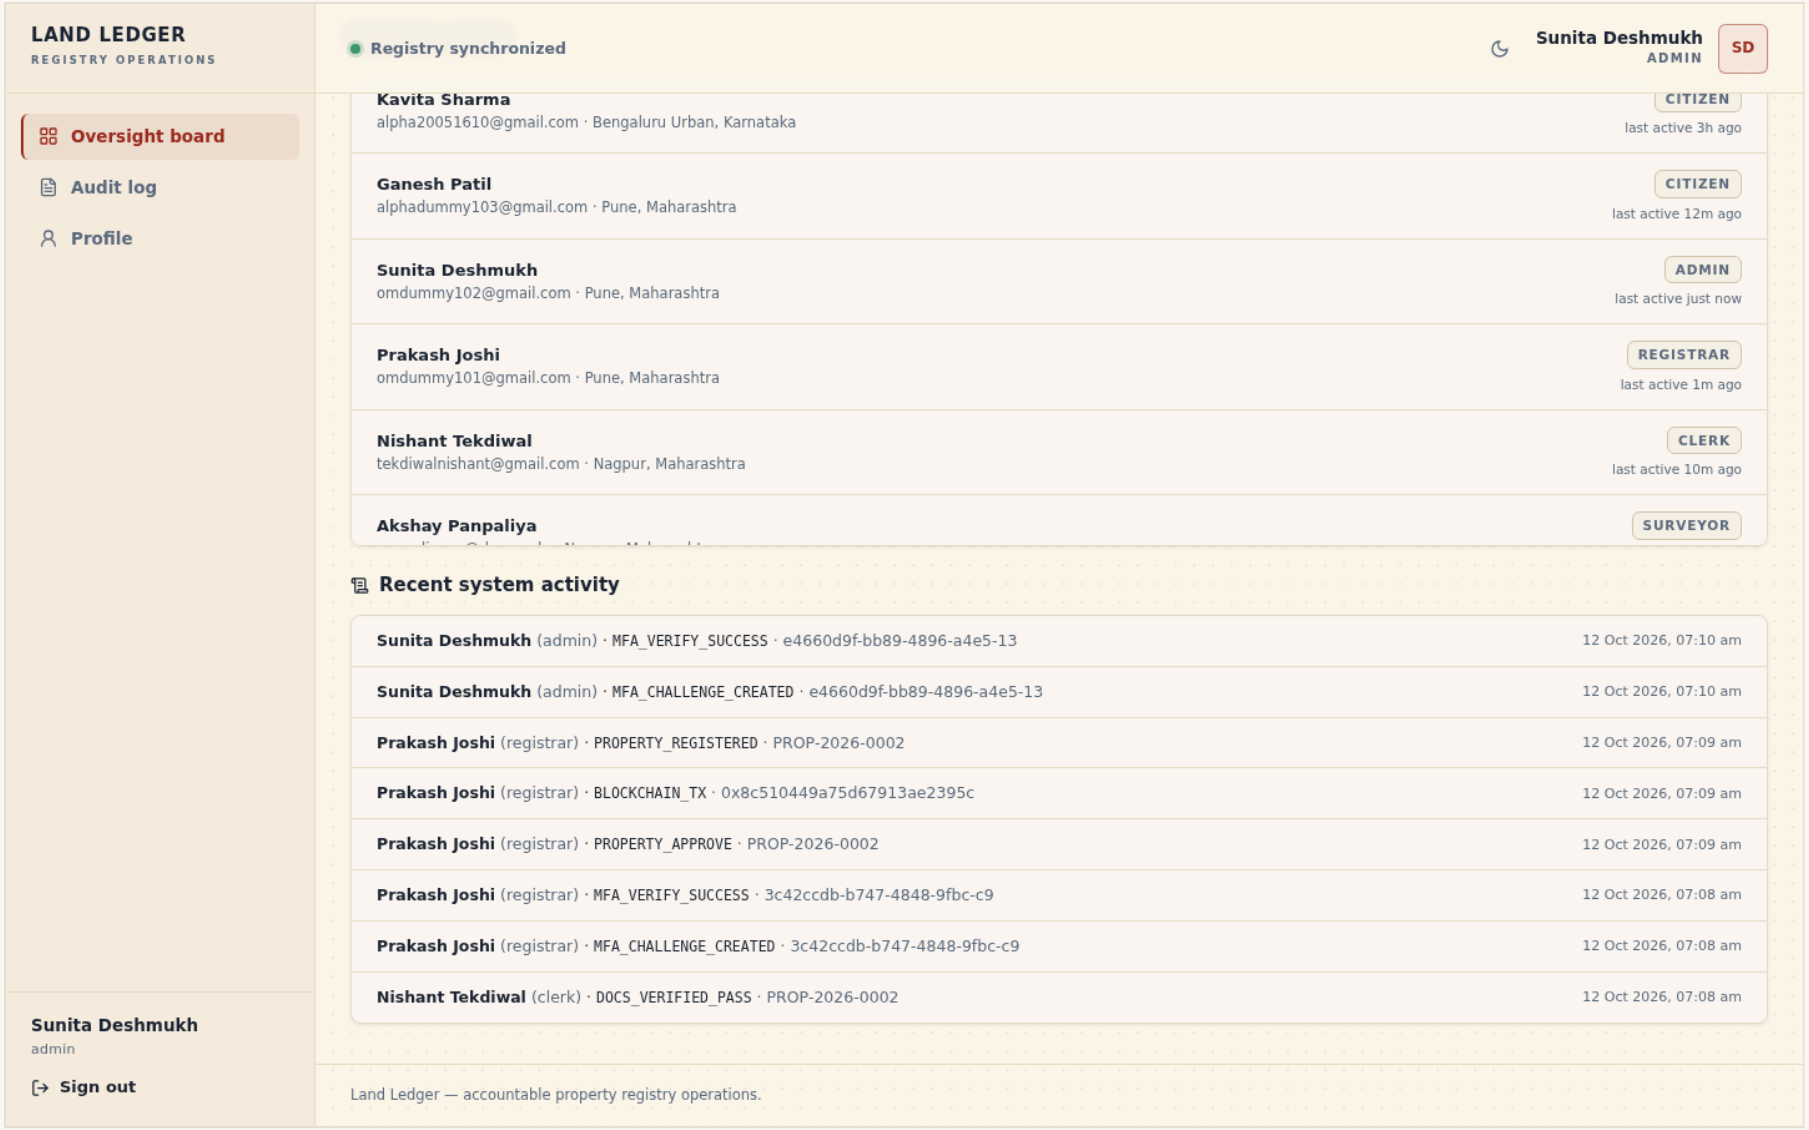

10

Admin sees the whole institution at once: roster, queues, cross-office metrics and the full audit log. The same system that serves a single citizen also gives the institution running it complete oversight - close the tour here.

Control tower

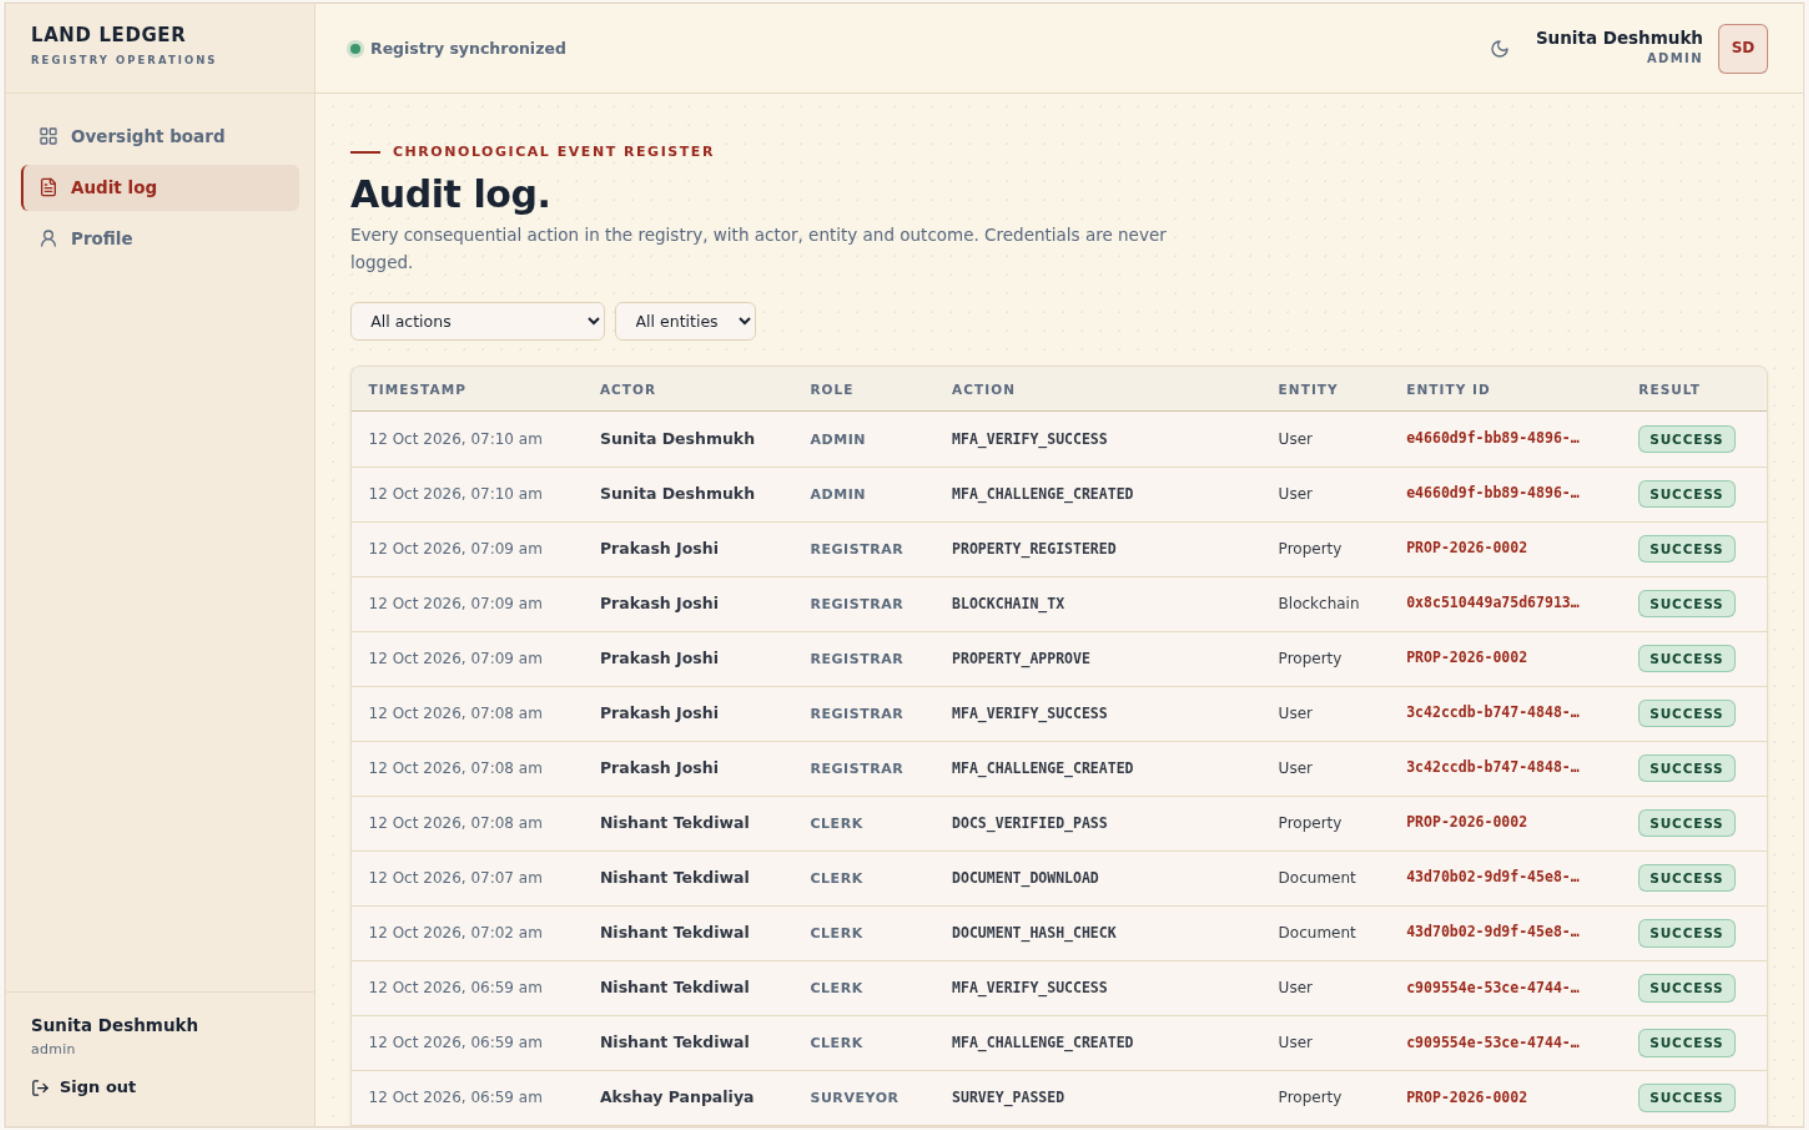

The admin control tower: cross-office metrics, queues and system health in one institution-wide view.

The user roster with roles and activity metrics - who holds which office, and how much work flows through each.

System-wide audit

The system-wide audit log closes the tour: every consequential action, permanently recorded. Trust is the product.

HANDOVER

Your demo kit

Everything below ships alongside this document - nothing else to prepare.

PRISTINE DEMO STATE (ALREADY RESTORED)

TRF-2026-0001	Waiting for party consent - Shruti and Ganesh can approve live
TRF-2026-0002	Sitting at the clerk's verification desk
TRF-2026-0003	Sitting at the registrar's legal review
TRF-2026-0004	Buyer consent pending

RECORDING

Companion recording: land-ledger-full-demo.mp4 (7:15) - same story, same order, performed live.
